

### True Multi-Touch Capacitive Touch Panel Controller

#### INTRODUCTION

The FT5x06 Series ICs are single-chip capacitive touch panel controller ICs with a built-in 8 bit Micro-controller unit (MCU). They adopt the mutual capacitance approach, which supports true multi-touch capability. In conjunction with a mutual capacitive touch panel, the FT5x06 have user-friendly input functions, which can be applied on many portable devices, such as cellular phones, MIDs, netbook and notebook personal computers.

The FT5x06 series ICs include FT5206/FT5306/FT5406, the difference of their specifications will be listed individually in this datasheet.

#### FEATURES

- Mutual Capacitive Sensing Techniques
- True Multi-touch with up to 10 Points of Absolution X and Y Coordinates
- Immune to RF Interferences
- Auto-calibration: Insensitive to Capacitance and Environmental Variations
- Supports up to 28 Transmit Lines and 16 Receive Lines
- Supports up to 8.9" Touch Screen
- Full Programmable Scan Sequences with Individual Adjustable Receive Lines and Transmit Lines to Support Various Applications
- High Report Rate: More than 100Hz
- Touch Resolution of 100 Dots per Inch (dpi) or above -- depending on the Panel Size
- Optional Interfaces :I2C/SPI
- 2.8V to 3.6V Operating Voltage
- Supports 1.8V/AVDD IOVCC
- Capable of Driving Single Channel (transmit/receive) Resistance: Up to 15K  $\Omega$
- Capable of Supporting Single Channel (transmit/receive) Capacitance: 60 pF
- Optimal Sensing Mutual Capacitor: 1pF~4pF
- 12-Bit ADC Accuracy
- Built-in MCU with 28KB Program Memory, 6KB Data Memory and 256B Internal Data Space
- 11 Internal Interrupt Sources and 2 External Interrupt Sources
- 3 Operating Modes
  - Active
  - Monitor
  - Hibernate
- Operating Temperature Range: -40°C to +85°C

## 1 OVERVIEW

### 1.1 Typical Applications

FT5x06 accommodate a wide range of applications with a set of buttons up to a 2D touch sensing device, their typical applications are listed below.

- Mobile phones, smart phones
- MIDs
- Netbook
- Navigation systems, GPS
- Game consoles
- Car applications
- POS (Point of Sales) devices
- Portable MP3 and MP4 media players
- Digital cameras

FT5x06 Series ICs support 2.8"~8.9" Touch Panel, users may find out their target IC from the specs. listed in the following table,

Model Name	Panel		Package			Touch Panel Size
	TX	RX	Type	Pin	Size	
FT5206GE1	15	10	QFN5*5	40	0.75-P0.4	2.8"~3.8"
FT5306DE4	20	12	QFN6*6	48	0.75-P0.4	4.3"~7"
FT5406EE8	28	16	QFN8*8	68	0.75-P0.4	7"~8.9"

## 2 FUNCTIONAL DESCRIPTION

### 2.1 Architectural Overview

Figure2-1 shows the overall architecture for the FT5x06.

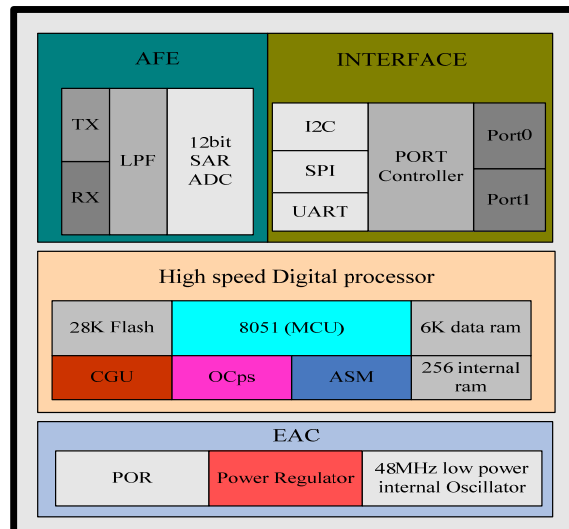

Figure 2-1 FT5x06 System Architecture Diagram

The FT5x06 is comprised of five main functional parts listed below,

- Touch Panel Interface Circuits

The main function for the AFE and AFE controller is to interface with the touch panel. It scans the panel by sending AC signals to the panel and processes the received signals from the panel. So, it supports both Transmit (TX) and Receive (RX) functions. Key parameters to configure this circuit can be sent via serial interfaces, which will be explained in detail in a later section.

- 8051-based MCU

This MCU is 8051 compatible with some enhancements. For instant, larger program and data memories are supported. In addition, a Multiplication-Division unit (MDU) is implemented to speed up the touch detection algorithms. Furthermore, a Flash ROM is implemented to store programs and some key parameters.

Complex signal processing algorithms are implemented with firmware running on this MCU to process further the received signals in order to detect the touches reliably. Communication protocol software is also implemented on this MCU to exchange data and control information with the host processor.

- External Interface

- I2C/SPI: an interface for data exchange with host
- INT: an interrupt signal to inform the host processor that touch data is ready for read
- WAKE: an interrupt signal for the host to change F5x06 from Hibernate to Active mode
- /RST: an external low signal reset the chip.

- A watch dog timer is implemented to ensure the robustness of the chip.

- A voltage regulator to generate 1.8V for digital circuits from the input VDD3 supply

## 2.2 MCU

This section describes some critical features and operations supported by the 8051 compatible MCU.

Figure 2-2 shows the overall structure of the MCU block. In addition to the 8051 compatible MCU core, we have added the following circuits,

- MDU: A 16x8 Multiplier and A 32/32 Divider
- Program Memory: 28KB Flash
- Data Memory: 6KB SRAM
- Real Time Clock (RTC): A 32KHz RC Oscillator
- Timer: A number of timers are available to generate different clocks
- Master Clock: 24/ 48MHz from a 48MHz RC Oscillator
- Clock Manager: To control various clocks under different operation conditions of the system

Figure 2-2 MCU Block Diagram

## 2.3 Operation Modes

FT5x06 operates in the following three modes:

- Active Mode

When in this mode, FT5x06 actively scans the panel. The default scan rate is 60 frames per second. The host processor can configure FT5x06 to speed up or to slow down.

- Monitor Mode

When in this mode, FT5x06 scans the panel at a reduced speed. The default scan rate is 25 frames per second and the host processor can increase or decrease this rate. When in this mode, most algorithms are stopped. A simpler algorithm is being executed to determine if there is a touch or not. When a touch is detected, FT5x06 shall enter the Active mode immediately to acquire the touch information quickly. During this mode, the serial port is closed and no data shall be transferred with the host processor.

- Hibernate Mode

In this mode, the chip is set in a power down mode. It shall only respond to the “WAKE” or “RESET” signal from the host processor. The chip therefore consumes very little current, which help prolong the standby time for the portable devices.

## 2.4 Host Interface

Figure 2-3 shows the interface between a host processor and FT5x06. This interface consists of the following three sets of signals:

- Serial Interface
- Interrupt from FT5x06 to the Host
- Wake-up Signal from the Host to FT5x06

Figure 2-3 Host Interface Diagram

The serial interfaces of FT5x06 is I2C or SPI. The details of this interface are described in detail in Section 2.5. The interrupt signal (/INT) is used for FT5x06 to inform the host that data are ready for the host to receive. The /WAKE signal is used for the host to wake up FT5x06 from the Hibernate mode. After exiting the Hibernate mode, FT5x06 shall enter the Active mode.

## 2.5 Serial Interface

FT5x06 supports the I2C or SPI interfaces, which can be used by a host processor or other devices.

### 2.5.1 I2C

The I2C is always configured in the Slave mode. The data transfer format is shown in Figure 2-4.

Figure 2-4 I2C Serial Data Transfer Format

Figure 2-5 I2C master write, slave read

Figure 2-6 I2C master read, slave write

Table 2-1 lists the meanings of the mnemonics used in the above figures.

**Table 2-1 Mnemonics Description**

Mnemonics	Description
S	I2C Start or I2C Restart
A[6:0]	Slave address A[6:4]: 3'b011 A[3:0]: data bits are identical to those of I2CCON[7:4] register.
W	1'b0: Write
R	1'b1: Read
A(N)	ACK(NACK)
P	STOP: the indication of the end of a packet (if this bit is missing, S will indicate the end of the current packet and the beginning of the next packet)

I2C Interface Timing Characteristics is shown in Table 2-2.

**Table 2-2 I2C Timing Characteristics**

Parameter	Unit	Min	Max
SCL frequency	KHz	0	400
Bus free time between a STOP and START condition	us	4.7	\
Hold time (repeated) START condition	us	4.0	\
Data setup time	ns	250	\
Setup time for a repeated START condition	us	4.7	\
Setup Time for STOP condition	us	4.0	\

### 2.5.2 SPI

SPI is a 4 wire serial interface. The following is a list of the 4 wires:

- SCK: serial data clock
- MOSI: data line from master to slave
- MISO: data line from slave to master
- SLVESEL: active low select signal

SPI transfers data at 8bit packets. The phase relationship between the data and the clock can be defined by the two registers: phase and polck. Some data transfer examples can be found in Figure 2-7 to Figure 2-10.

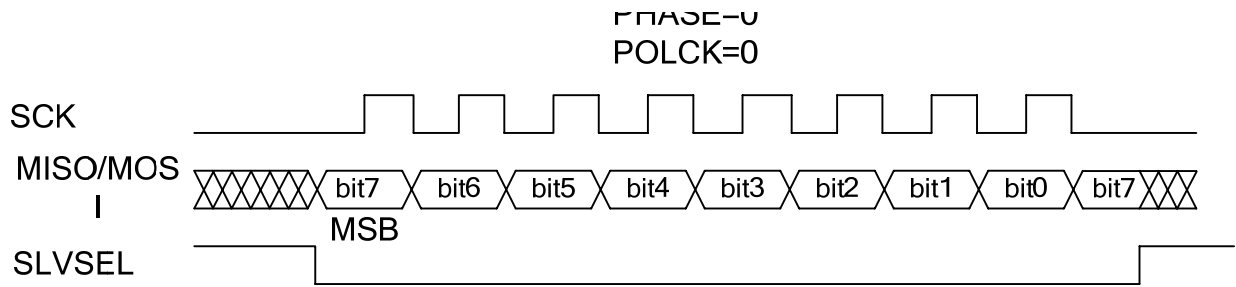

Figure 2-7 SPI Data Transfer Format (Phase=0, POLCK=0)

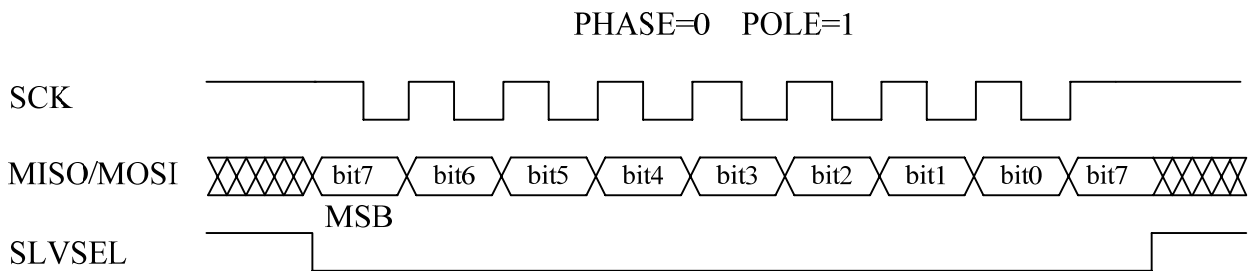

Figure 2-8 SPI Data Transfer Format (PHASE=0, POLCK=1)

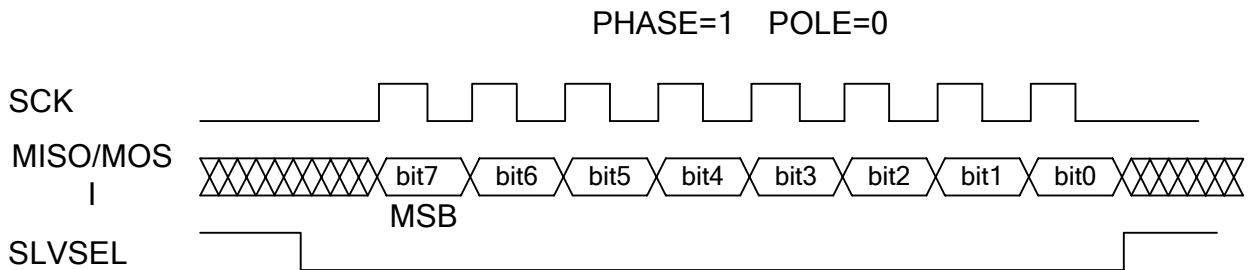

Figure 2-9 SPI Data Transfer Format (Phase=1, POLCK=0)

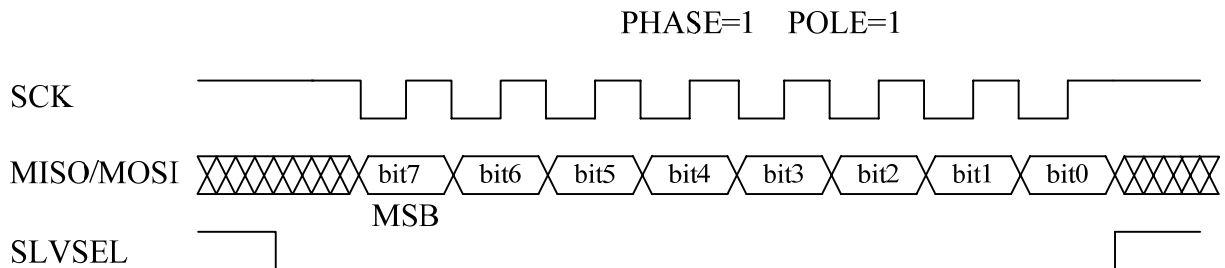

Figure 2-10 SPI Data Transfer Format (Phase=1, POLCK=1)

SPI can be configured into either Master or Slave mode via the MAS bit of the SPI0CON register. When in the Master mode, the SPI needs to supply the data clock, whose frequency relationship with the Master clock can be set by CLKDVD bits of the SPI0CON register. When it is configured in the Slave mode, the clock, SCK, is supplied by the external Master. The maximum data clock

frequency must not be higher than  $\frac{F_{mclk}}{8}$ .

SPI Interface Timing Characteristics is shown in the following Figure2-11, Figure2-12, Figure2-13, Figure2-14 and Table 2-3.

PHASE=0

Figure 2-11 SPI master Timing PHASE =0

PHASE=1

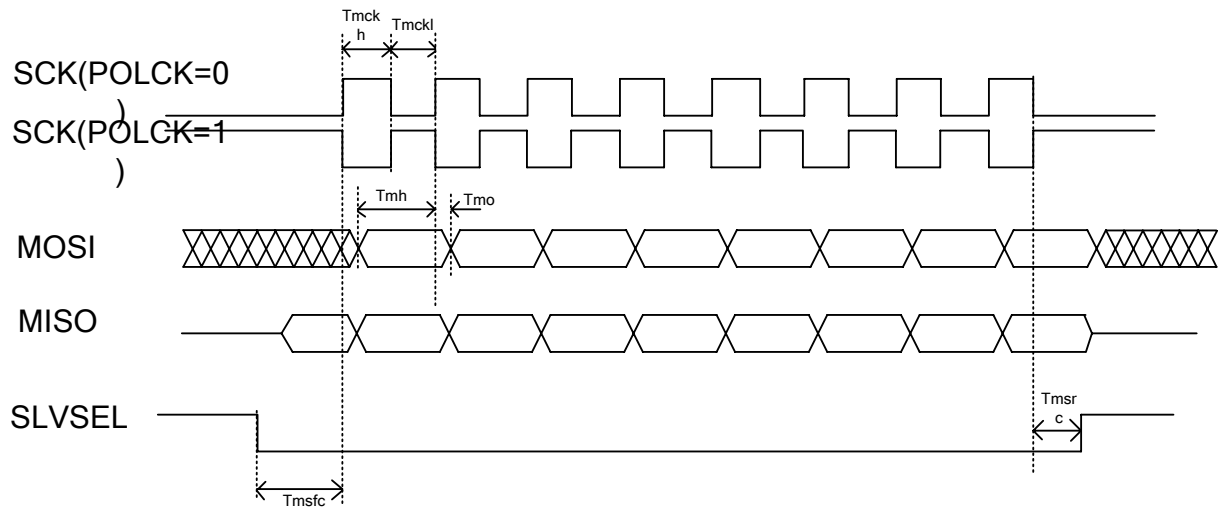

Figure 2-12 SPI master Timing PHASE =1

PHASE=0

Figure 2-13 SPI slave Timing PHASE = 0

PHASE=1

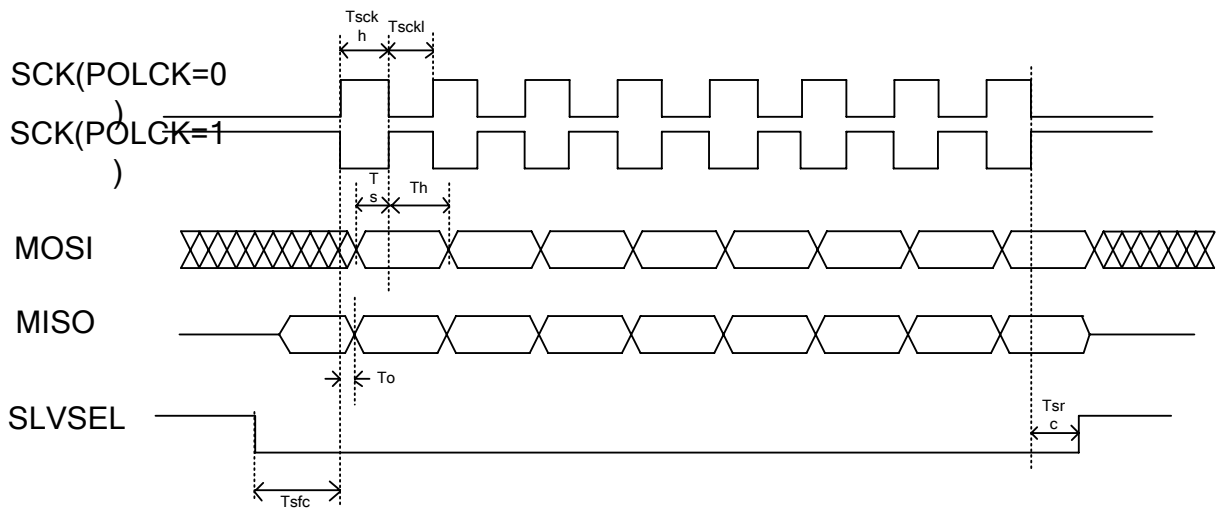

Figure 2-14 SPI slave Timing PHASE = 1

Table 2-3 SPI Timing Parameters

Parameter	Description	Min	Max	Units
Master Mode timing (see figure 2-11,2-12)				
Tmckh	sck high time	$4 \times Tsysclk$	--	ns
Tmckl	sck low time	$4 \times Tsysclk$	--	ns
Tmo	sck shift edge to mosi data change	0	--	ns
Tmh	mosi data valid to sck shift edge	$3 \times Tsysclk$	--	ns
Tsd	slvsel falling edge to mosi data valid	$4 \times Tsysclk$	--	ns
Tsf	slvsel falling edge to first sck edge	$(Tmckh+Tmckl)/2$	--	ns

Tmsrc	last sck edge to slvsel rising edge	$(Tmckh+Tmckl)/2$	--	ns
Slave mode timing(See figure 2-13,2-14)				
Tsckh	sck high Time	$4 \times Tsysclk$	--	ns
Tsckl	sck low Time	$4 \times Tsysclk$	--	ns
Tsd	slvsel falling edge to Miso valid data time	0	$4 \times Tsysclk$	ns
Ts	Mosi Data valid to sck sample edge	0	--	ns
Th	sck sample edge to Mosi data change	$4 \times Tsysclk$	--	ns
To	sck shift edge to Miso data change	0	$4 \times Tsysclk$	ns
Tsfc	slvsel falling edge to first sck edge	$4 \times Tsysclk$	--	ns
Tsrc	last sck edge to slvsel rising edge	$4 \times Tsysclk$	--	ns
*Tsysclk is equal to one period of the device system clock				

### 3 ELECTRICAL SPECIFICATIONS

#### 3.1 Absolute Maximum Ratings

**Table 3-1 Absolute Maximum Ratings**

Item	Symbol	Unit	Value	Note
Power Supply Voltage 1	VDDA - VSSA	V	-0.3 ~ +3.6	1, 2
Power Supply Voltage 2	VDD3 - VSS	V	-0.3 ~ +3.6	1, 3
I/O Power Supply Voltage	Vt	V	-0.3 ~ IOVCC + 0.3	1,4
Operating Temperature	Topr	°C	-40 ~ +85	1
Storage Temperature	Tstg	°C	-55 ~ +125	1

Notes

- 1.If used beyond the absolute maximum ratings, FT5x06 may be permanently damaged. It is strongly recommended that the device be used within the electrical characteristics in normal operations. If exposed to the condition not within the electrical characteristics, it may affect the reliability of the device.
- 2.Make sure VDDA(high)≥VSSA (low)
- 3.Make sure VDD (high)≥VSS (low)
- 4.IOVCC is set to VDD3 or VDDD by software configuration.

**3.2 DC Characteristics**
**Table 3-2 DC Characteristics (VDDA=VDD3=2.8~3.6V, Ta=-40~85°C)**

Item	Symbol	Unit	Test Condition	Min.	Typ.	Max.	Note
Input high-level voltage	VIH	V		0.7 x IOVCC	--	IOVCC	
Input low -level voltage	VIL	V		-0.3	--	0.3 x IOVCC	
Output high -level voltage	VOH	V	IOH=-0.1mA	0.7 x IOVCC	--	--	
Output low -level voltage	VOL	V	IOH=0.1mA	--	--	0.3 x IOVCC	
I/O leakage current	ILI	μA	Vin=0~VDDA	-1	--	1	
Current consumption (Normal operation mode)	Iopr	mA	VDDA=VDD3 = 2.8V Ta=25°C MCLK=24MHz	--	6	--	
Current consumption (Monitor mode)	Imon	mA	VDDA=VDD3 = 2.8V Ta=25°C MCLK=24MHz	--	4	--	
Current consumption (Sleep mode)	Islp	mA	VDDA=VDD3 = 2.8V Ta=25°C MCLK=24MHz	--	0.03	--	
Step-up output voltage	VDD5	V	VDDA=VDD3= 2.8V	5	5.25	5.6	
Power Supply voltage	VDDA VDD3	V		2.7	2.8~3.6	3.7	

**3.3 AC Characteristics**
**Table 3-3 AC Characteristics of Oscillators**

Item	Symbol	Unit	Test Condition	Min.	Typ.	Max.	Note
OSC clock 1	fosc1	MHz	VDD3 = 2.8V Ta=25°C	43	48	52	
OSC clock 2	fosc2	KHz	VDD3 = 2.8V Ta=25°C	29	32	36	

**Table 3-4 AC Characteristics of TX & RX**

Item	Symbol	Unit	Test Condition	Min	Typ	Max	Note
TX acceptable clock	ftx	KHz		100	150	270	
TX output rise time	Ttxr	nS		--	20	--	
TX output fall time	Ttxf	nS		--	20	--	
RX input voltage	Trxi	V		1.2	--	1.6

Figure 3-2 Digital In/Out Port Circuit

Figure 3-3 Reset Input Port Circuits

Figure 3-4 Wake Input Port Circuits

Figure 3-5 INT output Port Circuits

Figure 3-6 SCL/SDA Port Circuits

3.5 POWER ON/Reset/Wake Sequence

The GPIO such as Wake, INT and I2C should be pulled down to be low before powering on. The signal of waking up should be set to be high after powering on. INT signal will be sent to the host after initializing all parameters and then start to report points to the host.

Figure 3-7 Power on time

Figure 3-8 Power on Sequence

Reset time must be enough to guarantee reliable reset, The time of starting to report point after resetting approach to the time of starting to report point after powering on.

Figure 3-8 Reset Sequence

Wake time must be enough to wake up the system, The time of starting to report point after waking approach to the time of starting to report point after powering on

Figure 3-8 Wake Sequence

Table 3-5 Power on/Reset/Wake Sequence Parameters

Parameter	Description	Min	Max	Units
Tris	Rise time from 0.1VDD to 0.9VDD	--	10	ms
Tpon	Time of starting to report point after powering on	300	--	ms
Trsi	Time of starting to report point after resetting	300	--	ms
Trst	Reset time	5	--	ms
Twai	Time of starting to report point after waking	300	--	ms
Twak	Wake up time	5	--	ms

#### 4 PIN CONFIGURATIONS

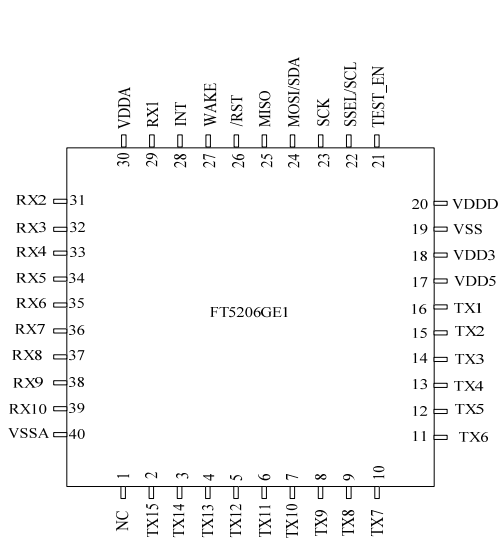

Pin List of FT5x06

Table 4-1 Pin Definition of FT5x06

Name	Pin No.			Type	Description
	FT5206GE1	FT5306DE4	FT5406EE8
