7.4.359 reg_SSIC_PORT_PROFILE_ATTRIBUTES_REG_type (PORT1_PROFILE_ATTRIBUTES_REG45)—Offset 89C0h

Access Method

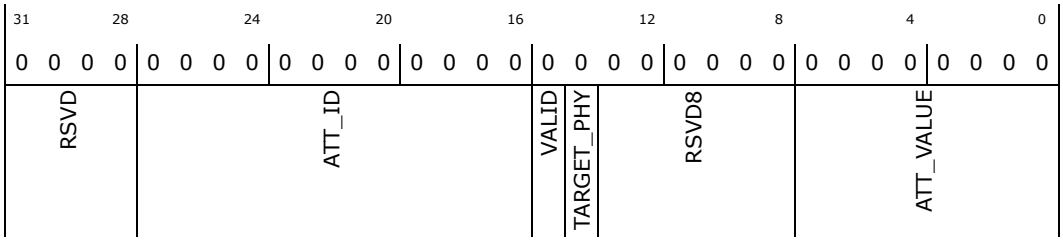
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 89C0h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:16	0x0 RW	**Attribute ID (ATT_ID):** Reserved. **Power Well:** Core
15	0x0 RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16 **Power Well:** Core
14	0x0 RW	**TARGET_PHY:** 0 = Remote Phy 1 = Local Phy **Power Well:** Core
13:8	0x0 RO	**Reserved (RSVD8):** Reserved. **Power Well:** Core
7:0	0x0 RW	**ATTRIBUTE VALUE (ATT_VALUE):** Reserved. **Power Well:** Core

7.4.360 reg_SSIC_PORT_PROFILE_ATTRIBUTES_REG_type (PORT1_PROFILE_ATTRIBUTES_REG46)—Offset 89C4h

Access Method

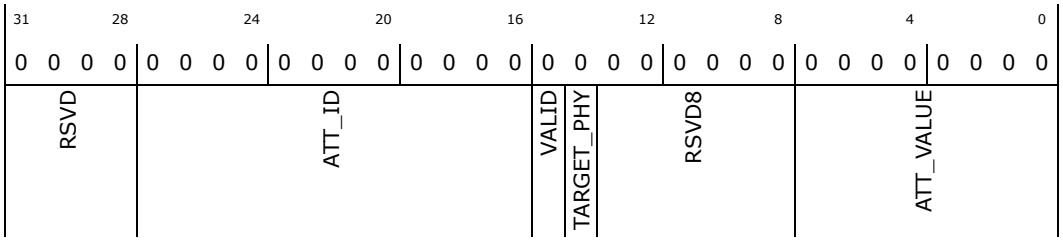
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 89C4h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:16	0x0 RW	**Attribute ID (ATT_ID):** Reserved. **Power Well:** Core
15	0x0 RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16 **Power Well:** Core
14	0x0 RW	**TARGET_PHY:** 0 = Remote Phy 1 = Local Phy **Power Well:** Core
13:8	0x0 RO	**Reserved (RSVD8):** Reserved. **Power Well:** Core
7:0	0x0 RW	**ATTRIBUTE VALUE (ATT_VALUE):** Reserved. **Power Well:** Core

7.4.361 reg_SSIC_PORT_PROFILE_ATTRIBUTES_REG_type (PORT1_PROFILE_ATTRIBUTES_REG47)—Offset 89C8h

Access Method

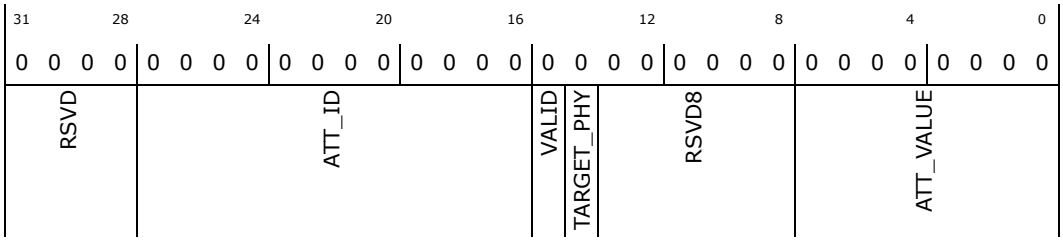
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 89C8h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:16	0x0 RW	**Attribute ID (ATT_ID):** Reserved. **Power Well:** Core
15	0x0 RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16 **Power Well:** Core
14	0x0 RW	**TARGET_PHY:** 0 = Remote Phy 1 = Local Phy **Power Well:** Core

7.4.378 SSIC Port N Register Access Control (PORT2_REGISTER_ACCESS_CONTROL)—Offset 8A14h

Access Method

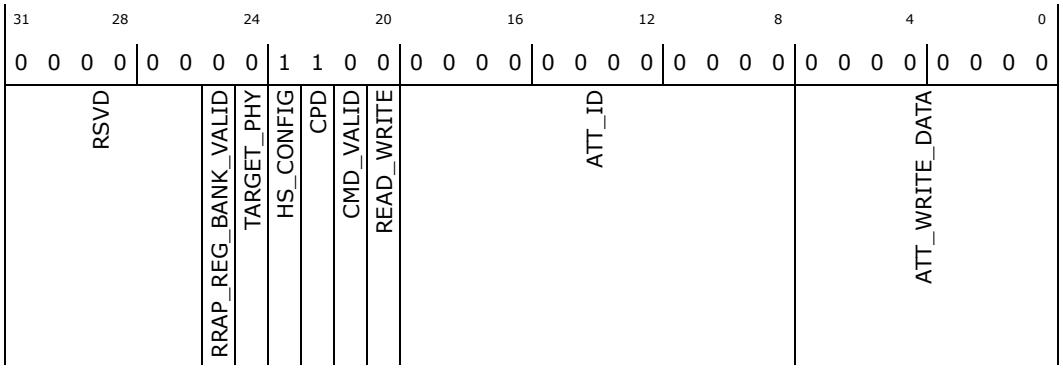
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 8A14h

Op Codes:

h - Read, h - Write

Default: 00C00000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
25	0x0 RW	**RRAP Register Bank Valid (RRAP_REG_BANK_VALID):** 0 = No valid Commands in the Lane N register bank. Host Controller can close the PWM burst once commands from this register are completed. 1 = Valid commands present in the Lane N register bank. Host controller must complete commands from the register bank before closing the burst. **Power Well:** Core
24	0x0 RW	**Target Phy (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy Setting this bit to 1 allows the use of this command mechanism to write to local Phy profile and AFE tuning registers Primarily as a back up option. **Power Well:** Core
23	0x1 RW	**HS_Config (HS_CONFIG):** When this bit is set to 1 the host controller will issue an RRAP write with HS_Config=1 once it sees Command Phase Done = 1 **Power Well:** Core
22	0x1 RW	**Command Phase Done (CPD):** When set to 1, this indicates that SW has completed performing RRAP cycles through the command register. **Power Well:** Core
21	0x0 RW	**Command Valid (CMD_VALID):** When written to 1 indicates that the Attribute ID and Attribute Data for writes fields are valid. **Power Well:** Core
20	0x0 RW	**Read_Write (READ_WRITE):** 0 = Write 1= Read **Power Well:** Core
19:8	0x0 RW	**Attribute ID (ATT_ID):** Attribute ID that is being written or read **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Attribute Write Data (ATT_WRITE_DATA):** Data byte that is required to be written to either the local phy or the remote phy **Power Well:** Core

7.4.379 SSIC Port N Register Access Status (PORT2_REGISTER_ACCESS_STATUS)—Offset 8A18h

Access Method

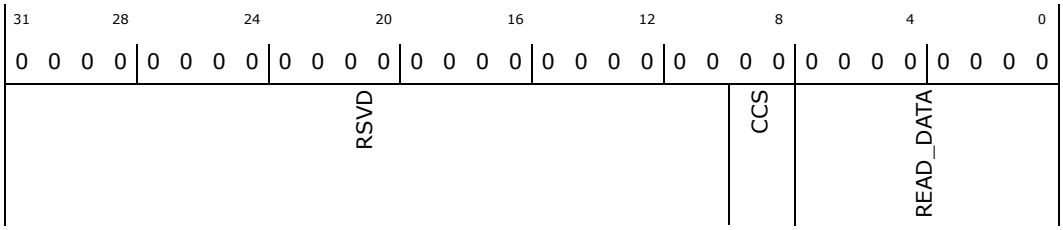
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 8A18h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
9:8	0x0 RW	**Command Completion Status (CCS):** 00 = Command not complete 01 = Command complete with Success 10 = Command complete with Error These bits must be cleared before a new command is initiated. **Power Well:** Core
7:0	0x0 RO	**Read data (READ_DATA):** Data read as a result of the RRAP operation **Power Well:** Core

7.4.380 reg_SSIC_PORT_PROFILE_ATTRIBUTES_REG_type (PORT2_PROFILE_ATTRIBUTES_REG0)—Offset 8A1Ch

Access Method

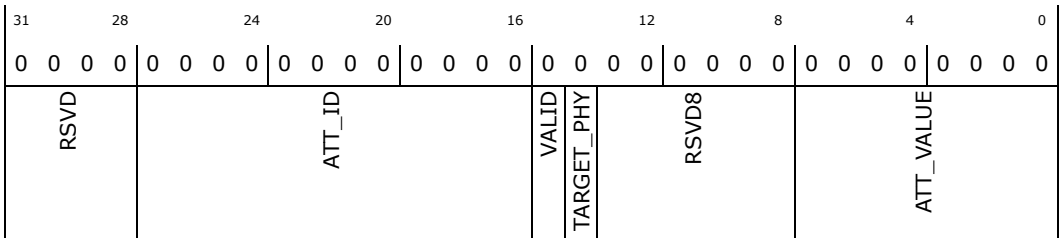
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x5A] + 8A1Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:16	0x0 RW	**Attribute ID (ATT_ID):** Reserved. **Power Well:** Core
15	0x0 RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16 **Power Well:** Core
14	0x0 RW	**TARGET_PHY:** 0 = Remote Phy 1 = Local Phy **Power Well:** Core

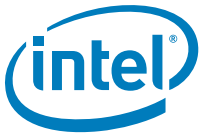
F07C–F07Fh	4	"reg_CMNREG19_type (CMNREG19)—Offset F07Ch" on page 2947	16010C0Ch



Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
F080–F083h	4	"reg_CMNREG20_type (CMNREG20)—Offset F080h" on page 2948	00000000h
F084–F087h	4	"reg_CMNREG21_type (CMNREG21)—Offset F084h" on page 2948	00000000h
F088–F08Bh	4	"reg_CMNREG22_type (CMNREG22)—Offset F088h" on page 2949	00000000h

7.5.1 reg_CMNREG1_type (CMNREG1)—Offset F000h

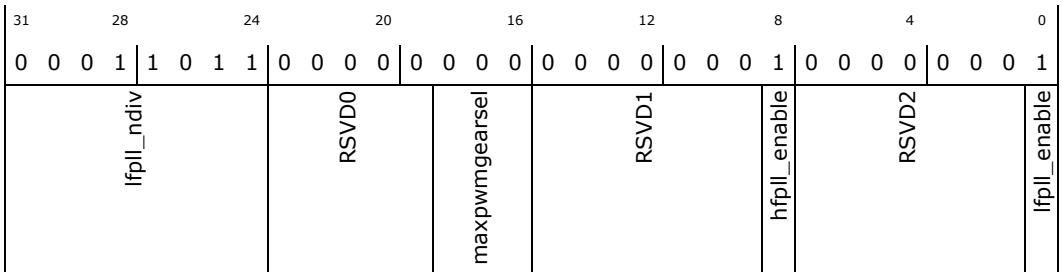
CMNREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F000h

Default: 1B000101h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x1b RW	**lfpll_ndiv:** Low Frequency Divider Setting sets divide ratio to generate pwmck from hsck. For 19.2Mhz refclk: Rate A=0x17, Rate B=0x1b; For 26Mhz refclk: Rate A=0x17; Rate B=0x1A
23:19	0x0 RO	**RSVD0:** Reserved
18:16	0x0 RW	**maxpwmgearsel:** Select divisor value for max PWM trunk clock. For functional mode this setting must be set to 0 at all times.
15:9	0x0 RO	**RSVD1:** Reserved
8	0x1 RW	**hfpll_enable:** Enable PLL Enables VCO bias and VCO outputs Enables analog circuits inside PLL
7:1	0x0 RO	**RSVD2:** Reserved
0	0x1 RW	**lfpll_enable:** Enable LF PLL for trunk clock.

7.5.2 reg_CMNREG2_type (CMNREG2)—Offset F004h

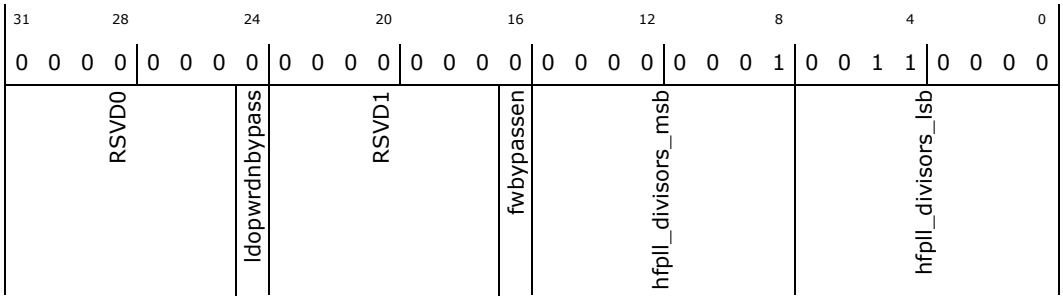
CMNREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F004h

Default: 00000130h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**ldopwrdnbypass:** LDO bypass mode enable for debug.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**fwbypassen:** Overrides the FW logic
15:8	0x1 RW	**hfpll_divisors_msb:** HFPLL feedback divisors. For 19.2Mhz refclk, set to 1. For 26Mhz and 25MHz(HBP), set to 0.
7:0	0x30 RW	**hfpll_divisors_lsb:** HFPLL feedback divisors. For 19.2Mhz refclk: Rate A=0x04; Rate B=0x30. For 26Mhz refclk: Rate A=0xc0; Rate B=0xe0; For 25Mhz refclk(HBP): Rate A=0xc8; Rate B=0xF0

7.5.3 reg_CMNREG3_type (CMNREG3)—Offset F008h

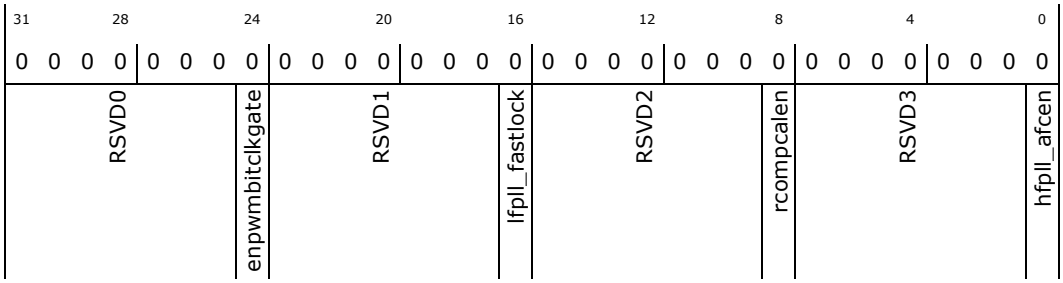
CMNREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F008h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**enpwmbitclkgate:** pwm bit clock gating enable (1=enable ck, 0=ck gated).
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**lfpll_fastlock:** Enable fast lock using previously calibrated values
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**rcompcalen:** RCOMP Calibration enable
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**hfpll_afcen:** Enable automatic frequency counter. Default should be enabled (=1). Only disable in debug mode.

7.5.4 reg_CMNREG4_type (CMNREG4)—Offset F00Ch

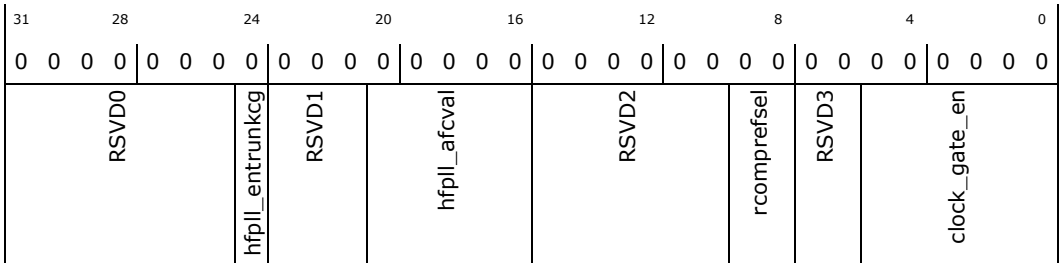
CMNREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F00Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**hfpll_entrunkcg:** Enable maxhsck (trunck clock). 1=enabled, 0=gated.
23:21	0x0 RO	**RSVD1:** Reserved
20:16	0x0 RW	**hfpll_afcval:** AFC tuning bits used to force coarse fequency setting when the AFC is disabled, Used in debug only.

Bit Range	Default & Access	Field Name (ID): Description
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x0 RW	**rcomprefsel:** NA
7:6	0x0 RO	**RSVD3:** Reserved
5:0	0x0 RW	**clock_gate_en:** [0]: MaxHSClk High speed trunk clock gate enable; [1] MaxPWMClk trunk clock gate enable; [2] pll_ref_clk clock gate enable; [3] rmmi_ref_clk clock gate enable; [4] pll_ref_clk trunk clock gate enable; [5] rmmi_cfg_clk trunk clock gate en;

7.5.5 reg_CMNREG5_type (CMNREG5)—Offset F010h

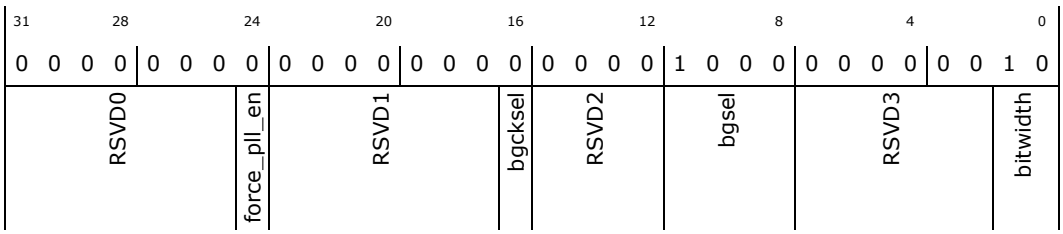
CMNREG5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F010h

Default: 00000802h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**force_pll_en:** Enable the PLL after power up and reset de-assertion. When set, PLL will not be shutdown unless common lane core is being powered down.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**bgcksel:** band gap clock select. 0- Reference clock:: 1- Reference Clock/2.
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x8 RW	**bgsel:** Bandgap voltage trim.
7:2	0x0 RO	**RSVD3:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0x2 RW	**bitwidth:** Divider setting for trunk clocks. 01: divide by 2 (10bit RMMI); 10: divide by 4 (20bit RMMI); 11: divide by 8 (40bit RMMI); 00: reserved

7.5.6 reg_CMNREG6_type (CMNREG6)—Offset F014h

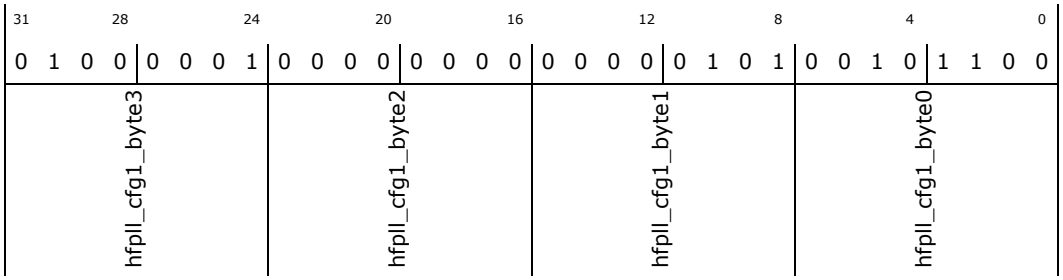
CMNREG6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F014h

Default: 4100052Ch



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x41 RW	**hfpll_cfg1_byte3:** HFPLL configuration register as required by AFE bits [31:24]. ANN: [31:30]=lockthresh[1:0], [29:25]=lpf_gain[4:0], [24]=lfp_maxstep[4]. Initialize to 0x81. SoC: [30]=lockthresh[0], [29]=lpfrstmode, [28:26]=pfdchop[2:0], [25]=pfdchopen, [24]=pfdresipw
23:16	0x0 RW	**hfpll_cfg1_byte2:** HFPLL configuration register as required by AFE bits [23:16]. ANN: [23:20]=lfp_maxstep[3:0], [19:16]=cselext[8:5]. Initialize to 0xF0. SoC: [23:22]=pfdresipw[1:0], [21:16]=tcompcode[7:2]. Initialize to 0.
15:8	0x5 RW	**hfpll_cfg1_byte1:** HFPLL configuration register as required by AFE bits [15:8]. ANN: [15:11]=cselext[4:0], [10:8]=vcoamp[3:1]. Initialize to 0. SoC: [15:14]=tcompcode[1:0], [13]=tcompen, [12:11]=tcomprange[1:0], [10:8]=ivco[3:1]. Initial setting Rate A: 0x03 Rate B: 0x
7:0	0x2c RW	**hfpll_cfg1_byte0:** HFPLL configuration register as required by AFE bits [7:0]. ANN: [7]=vcoamp[0], [6:5]=reserved, [4:3]=lpf_avg[1:0], [2:0]=pllmodesel[2:0]. Initialize to 0x15. SoC: [7]=ivco[0], [6]=ivcoextra, [5:3]=vcovarcm1[2:0], [2:0]=vcovarcm2[2:0]. Initialize to 0

7.5.7 reg_CMNREG7_type (CMNREG7)—Offset F018h

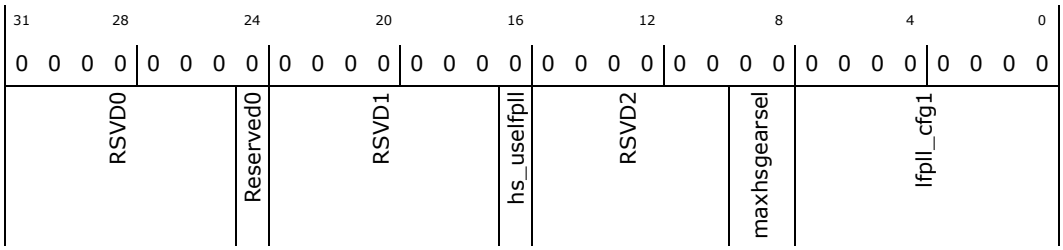
CMNREG7

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F018h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RO	**Reserved0:** Reserved
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**hs_uselfpll:** Use LFPLL for high speed clocks.
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x0 RW	**maxhsgearsel:** Sets max trunk clock frequency for HS supported on a product. 00: divide by 1 (Gear3) 01: divide by 2 (Gear2) 10: divide by 4 (Gear1) 11: divide by 8 (NA)
7:0	0x0 RW	**lfpll_cfg1:** [2:0] - lockctr: [4:3] - lockdiv: [7:5] - lockthresh.

7.5.8 reg_CMNREG8_type (CMNREG8)—Offset F01Ch

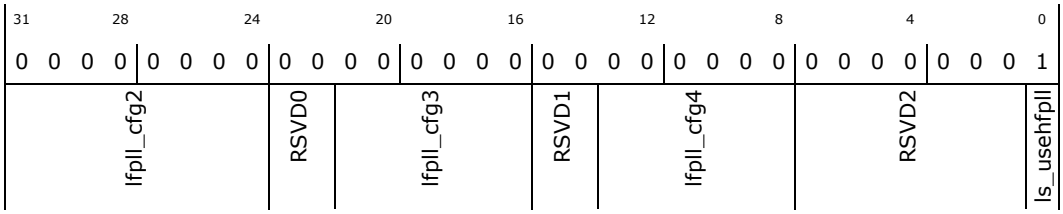
CMNREG8

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F01Ch

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**lfpll_cfg2:** [2:0] - adaptivemin: [3] - adaptivethresh: [5:4] - pdgain: [6]-relocken: [7] - shiften.

Bit Range	Default & Access	Field Name (ID): Description
23:22	0x0 RO	**RSVD0:** Reserved
21:16	0x0 RW	**lfpll_cfg3:** [2:0] - shiftki[2:0]: [5:3] - shfitkii.
15:14	0x0 RO	**RSVD1:** Reserved
13:8	0x0 RW	**lfpll_cfg4:** [2:0] - shiftp[2:0]: [5:3] - shfitpi.
7:1	0x0 RO	**RSVD2:** Reserved
0	0x1 RW	**ls_usehfpll:** Use HFPLL for PWM clocks. For ANN this must be 1 at all times. For SoC the POR is set to 1.

7.5.9 reg_CMNREG9_type (CMNREG9)—Offset F020h

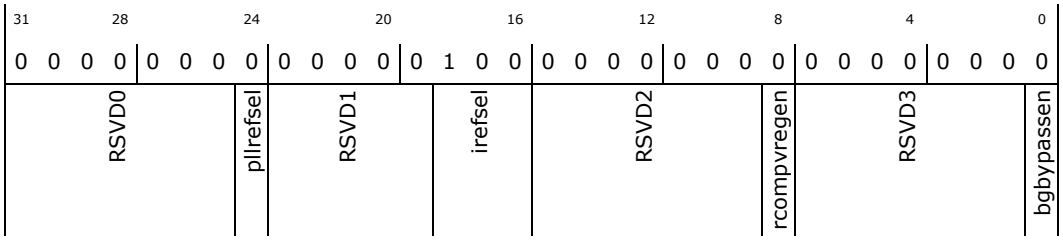
CMNREG9

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F020h

Default: 00040000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**pllrefsel:** Reference clock select 1'b0 - From SoC: 1'b1 - From external bumps. In functional mode only clock from SoC is supported
23:19	0x0 RO	**RSVD1:** Reserved
18:16	0x4 RW	**irefsel:** Reference current amplitude select
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**rcompvregen:** enable vreg for RCOMP driver

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**bgbypassen:** Bandgap bypass enable.

7.5.10 reg_CMNREG10_type (CMNREG10)—Offset F024h

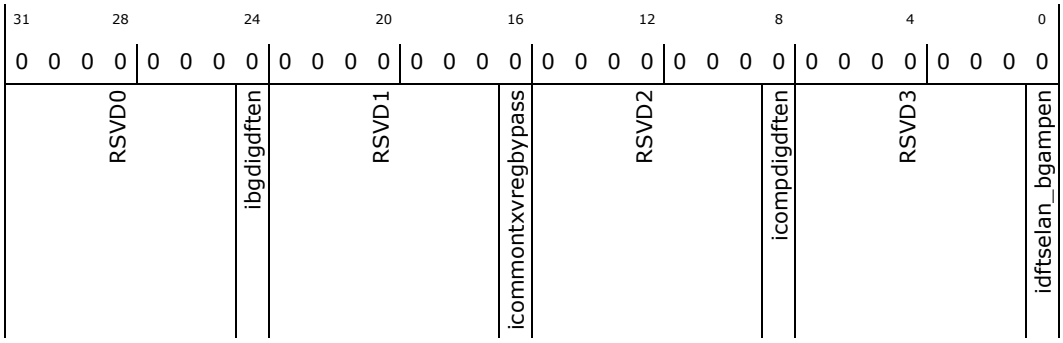
CMNREG10

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F024h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**ibgdigdften:** BG DFT enable.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**icommontxvregbypass:** bypass vreg for RCOMP driver
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**icompdigdften:** COMP DFT enable
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**idftselan_bgampen:** DFT select, analog, one hot

7.5.11 reg_CMNREG11_type (CMNREG11)—Offset F028h

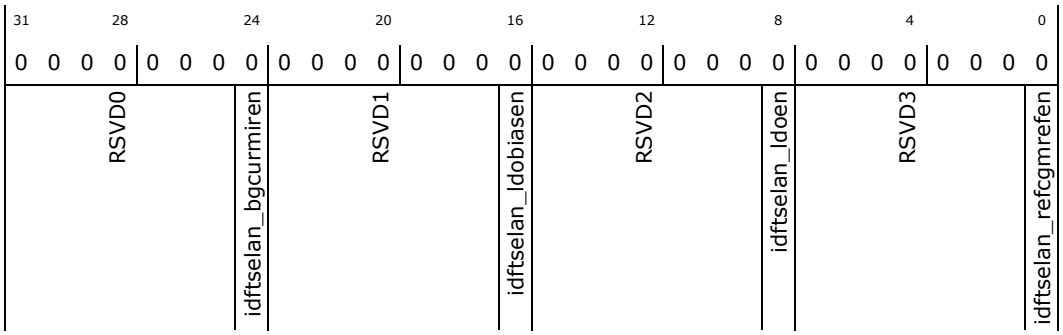
CMNREG11

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F028h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**idftselan_bgcurmiren:** DFT select, analog, one hot.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**idftselan_ldobiasen:** DFT select, analog, one hot.
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**idftselan_ldoen:** DFT select, analog, one hot.
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**idftselan_refcgmrefen:** DFT select, analog, one hot

7.5.12 reg_CMNREG12_type (CMNREG12)—Offset F02Ch

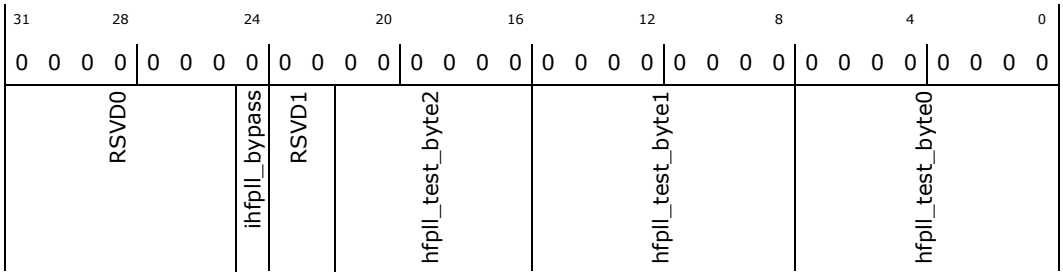
CMNREG12

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F02Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**ihfpll_bypass:** HFPLL Bypass Passes refclk PLL input directly onto PLL output
23:22	0x0 RO	**RSVD1:** Reserved
21:16	0x0 RW	**hfpll_test_byte2:** HFPLL Test Control Placeholder for HFPLL test control vcoidven, vctlobsen
15:8	0x0 RW	**hfpll_test_byte1:** HFPLL Test Control Placeholder for HFPLL test control vcoidven, vctlobsen
7:0	0x0 RW	**hfpll_test_byte0:** HFPLL Test Control Placeholder for HFPLL test control vcoidven, vctlobsen

7.5.13 reg_CMNREG13_type (CMNREG13)—Offset F030h

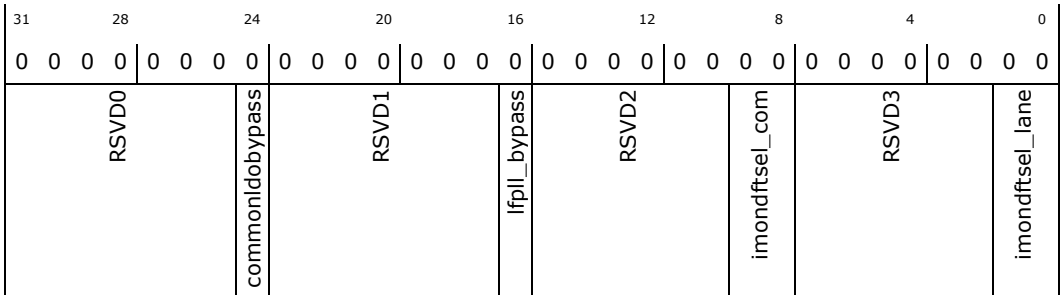
CMNREG13

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F030h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 RW	**commonldobypass:** bypass LDO in COMMON lane.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**lfpll_bypass:** Low Frequency Bypass . Drives refclk onto pwmckp/n .
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x0 RW	**imondftsel_com:** DFT select. Select common lane digital signals
7:2	0x0 RO	**RSVD3:** Reserved
1:0	0x0 RW	**imondftsel_lane:** DFT select. Select left or right lanes digital signals

7.5.14 reg_CMNREG14_type (CMNREG14)—Offset F034h

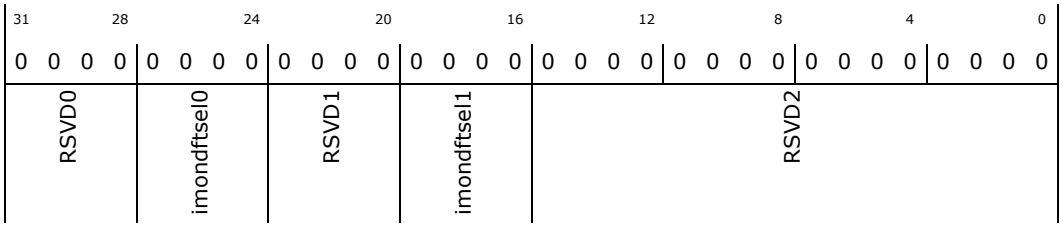
CMNREG14

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F034h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x0 RW	**imondftsel0:** select which internal digital signals in COMMON
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0x0 RW	**imondftsel1:** select which internal digital signals in COMMON
15:0	0x0 RO	**RSVD2:** Reserved

7.5.15 reg_CMNREG15_type (CMNREG15)—Offset F038h

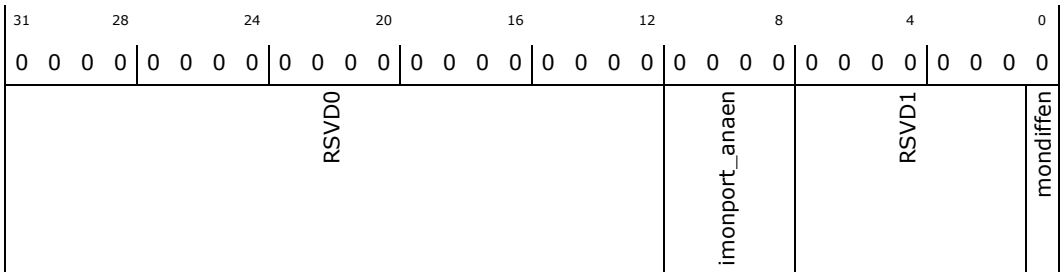
CMNREG15

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F038h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RW	**imonport_anaen:** enable analog monitor paths. Choose mapping between 2 analog buses and 2 monitor ports.
7:1	0x0 RO	**RSVD1:** Reserved
0	0x0 RW	**mondiffen:** enable differential monitoring mode

7.5.16 reg_CMNREG16_type (CMNREG16)—Offset F03Ch

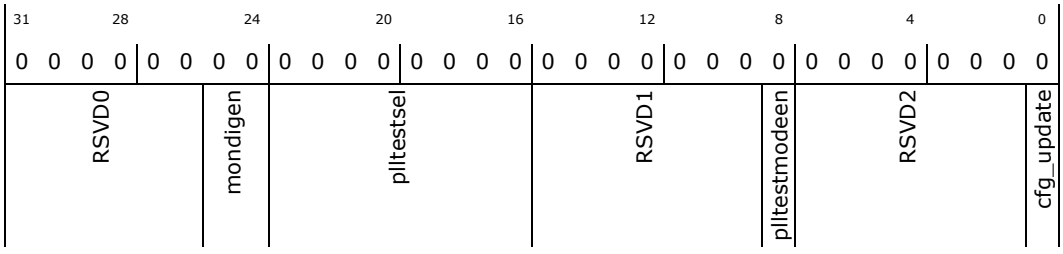
CMNREG16

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F03Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x0 RW	**mondigen:** enable digital monitor drivers.
23:16	0x0 RW	**plltestsel:** select which internal signal in the PLL to send to monitor bumps.
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**plltestmodeen:** mask test config bits.
7:1	0x0 RO	**RSVD2:** Reserved
0	0x0 RW	**cfg_update:** Configuration update to copy the shadow register contents to the effective register

7.5.17 reg_DFXREG0_type (DFXREG0)—Offset F040h

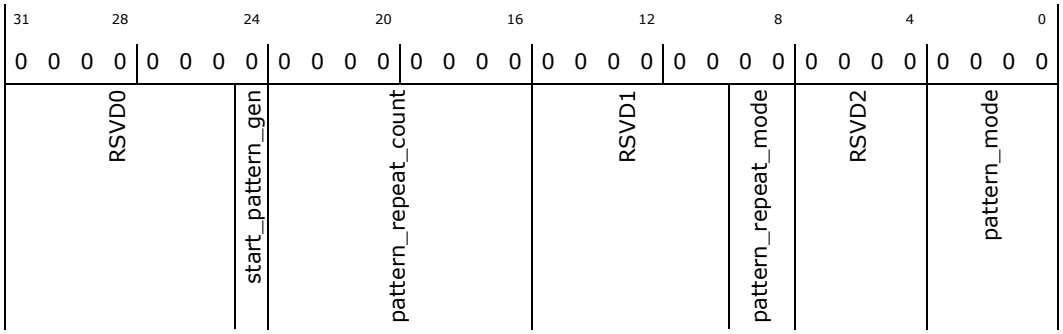
DFXREG0

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F040h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**start_pattern_gen:** 1'b1 = Starts pattern gen in continous mode , 1'b0 = stop the continous burst.
23:16	0x0 RW	**pattern_repeat_count:** The count for which pattern repeats. Any 8 bit non zero value
15:10	0x0 RO	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
9:8	0x0 RW	**pattern_repeat_mode:** 8h1 8bit repeat count, 8h2 11bit repeat count, 8h3 continuous mode
7:4	0x0 RO	**RSVD2:** Reserved
3:0	0x0 RW	**pattern_mode:** 8h1 CJTPAT, 8h2 CRPAT, 8h3 UserDefined

7.5.18 reg_DFXREG1_type (DFXREG1)—Offset F044h

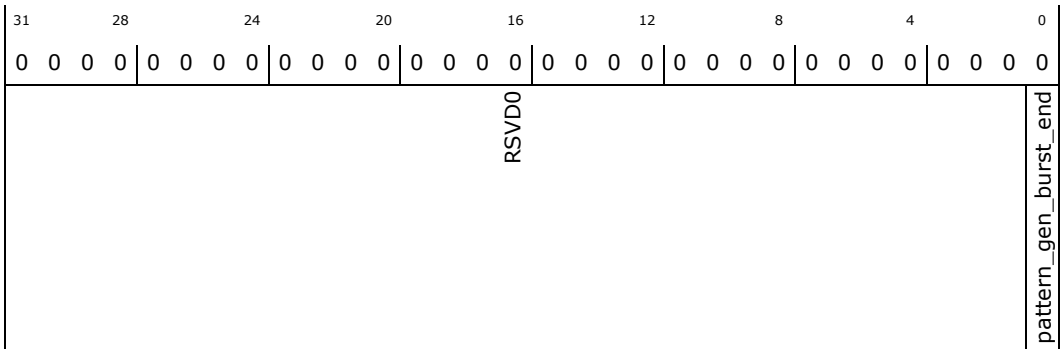
DFXREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F044h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW/1C	**pattern_gen_burst_end:** Set by hardware to indicate that the pattern generation burst has completed.The software has to then write 1 into patter_gen_burst_end field to clear this.

7.5.19 reg_DFXREG2_type (DFXREG2)—Offset F048h

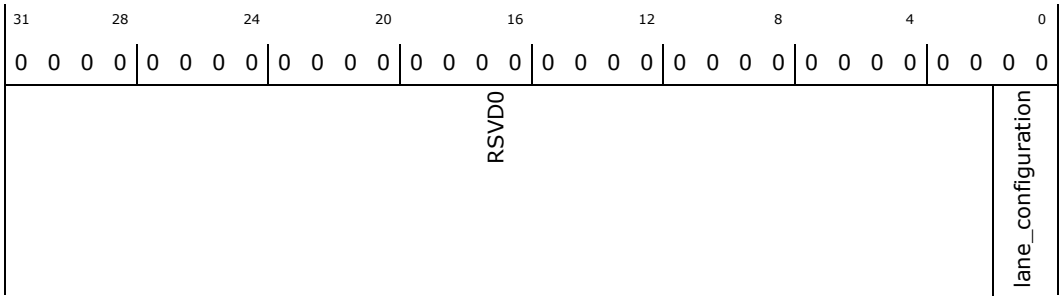
DFXREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F048h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**RSVD0:** Reserved
1:0	0x0 RW	**lane_configuration:** 0: lane0 only 1: lane0, lane1 only 2: lane0, lane1, lane2 only 3: All lanes present

7.5.20 reg_DFXREG3_type (DFXREG3)—Offset F04Ch

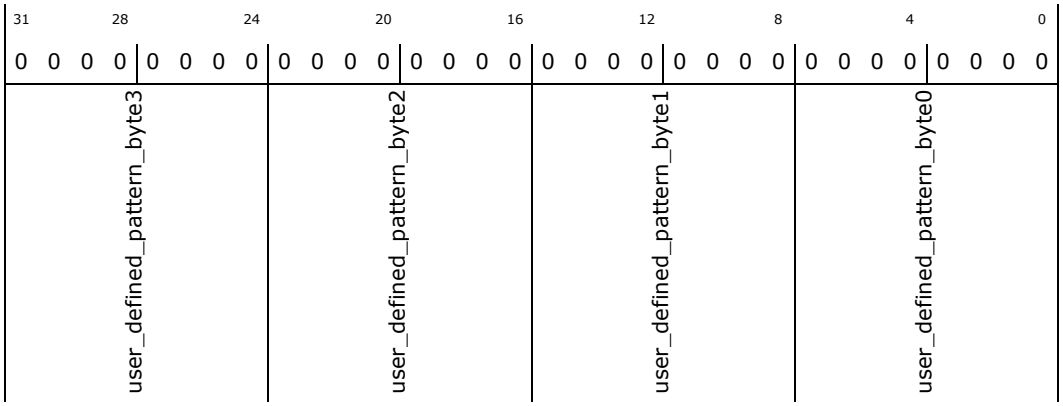
DFXREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F04Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**user_defined_pattern_byte3:** Register value of user defined pattern .Upper 8 bits are not sent - reserved.
23:16	0x0 RW	**user_defined_pattern_byte2:** Register value of user defined pattern Upper 8 bits are not sent - reserved.
15:8	0x0 RW	**user_defined_pattern_byte1:** Register value of user defined pattern

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**user_defined_pattern_byte0:** Register value of user defined pattern

7.5.21 reg_DFXREG4_type (DFXREG4)—Offset F050h

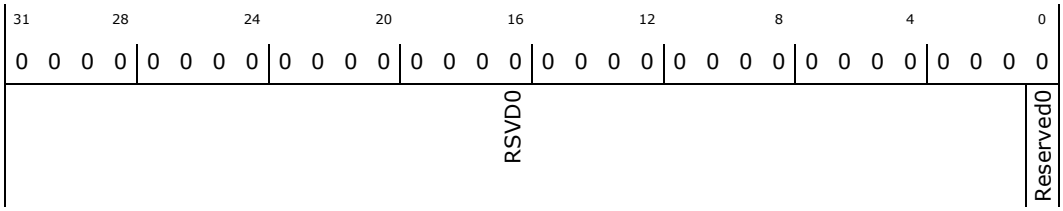
DFXREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F050h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RO	**Reserved0:** reserved.

7.5.22 reg_DFXREG5_type (DFXREG5)—Offset F054h

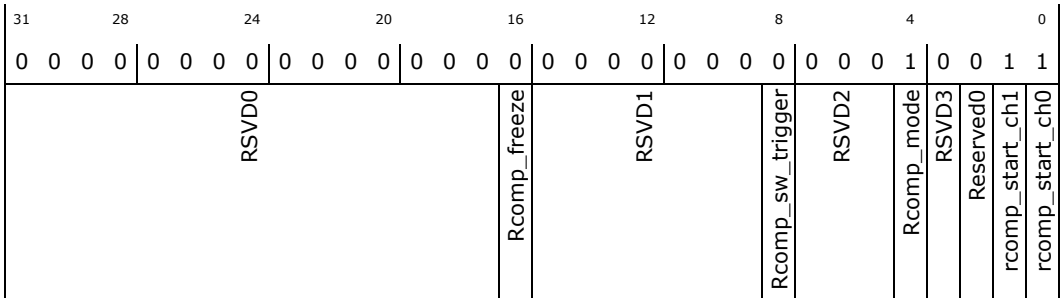
DFXREG5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F054h

Default: 00000013h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RW	**Rcomp_freeze:** Writing 1'b1 will cause RCOMP FSM and controller to freeze at the point in the FSM. It wont respond to AFE.
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**Rcomp_sw_trigger:** 1'b1 trigger's RCOMP FSM via software. Write 0 to clear it.
7:5	0x0 RO	**RSVD2:** Reserved
4	0x1 RW	**Rcomp_mode:** 1: AUTO-RCOMP mode. 0: SW-RCOMP
3	0x0 RO	**RSVD3:** Reserved
2	0x0 RO	**Reserved0:** reserved.
1	0x1 RW	**rcomp_start_ch1:** This bit set would indicate the RCOMP to be enabled. Setting it to zero, RCOMP would be turned off for channle1.
0	0x1 RW	**rcomp_start_ch0:** This bit set would indicate the RCOMP to be enabled. Setting it to zero, RCOMP would be turned off for channel0

7.5.23 reg_DFXREG6_type (DFXREG6)—Offset F058h

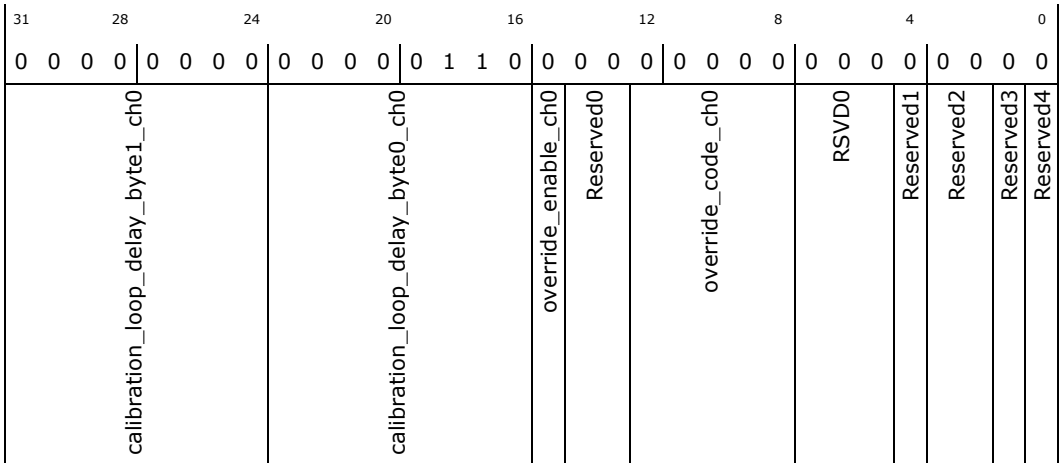
DFXREG6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F058h

Default: 00060000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**calibration_loop_delay_byte1_ch0:** Specifies number of clock cycles to be used for sampling the upcount from AFE.
23:16	0x6 RW	**calibration_loop_delay_byte0_ch0:** Specifies number of clock cycles to be used for sampling the upcount from AFE.
15	0x0 RW	**override_enable_ch0:** Rcomp override enable for CH0
14:13	0x0 RO	**Reserved0:** reserved.
12:8	0x0 RW	**override_code_ch0:** Rcomp override code for CH0
7:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RO	**Reserved1:** reserved.
3:2	0x0 RO	**Reserved2:** reserved.
1	0x0 RO	**Reserved3:** reserved.
0	0x0 RO	**Reserved4:** reserved.

7.5.24 reg_DFXREG7_type (DFXREG7)—Offset F05Ch

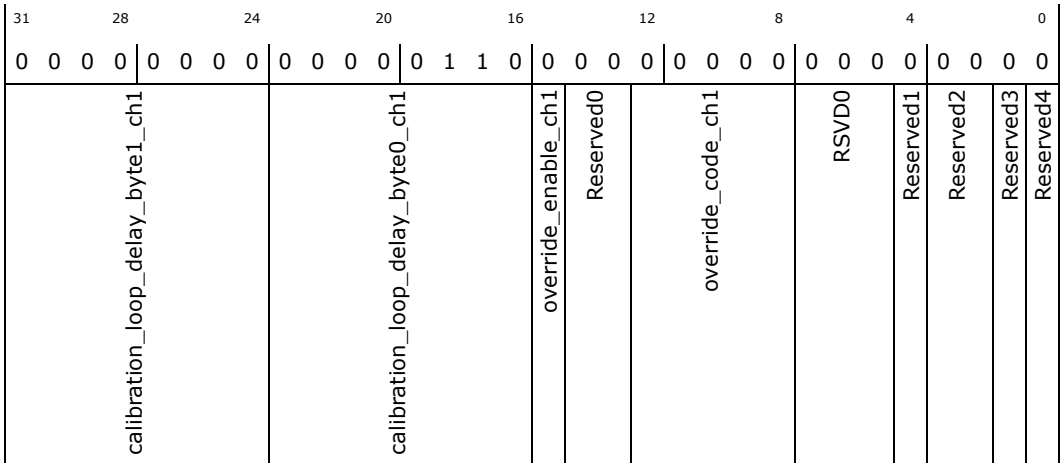
DFXREG7

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F05Ch

Default: 00060000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**calibration_loop_delay_byte1_ch1:** Specifies number of clock cycles to be used for sampling the upcount from AFE.
23:16	0x6 RW	**calibration_loop_delay_byte0_ch1:** Specifies number of clock cycles to be used for sampling the upcount from AFE.
15	0x0 RW	**override_enable_ch1:** Rcomp override enable for CH1
14:13	0x0 RO	**Reserved0:** reserved.
12:8	0x0 RW	**override_code_ch1:** Rcomp override code for CH1
7:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RO	**Reserved1:** reserved.
3:2	0x0 RO	**Reserved2:** reserved.
1	0x0 RO	**Reserved3:** reserved.
0	0x0 RO	**Reserved4:** reserved.

7.5.25 reg_DFXREG8_type (DFXREG8)—Offset F060h

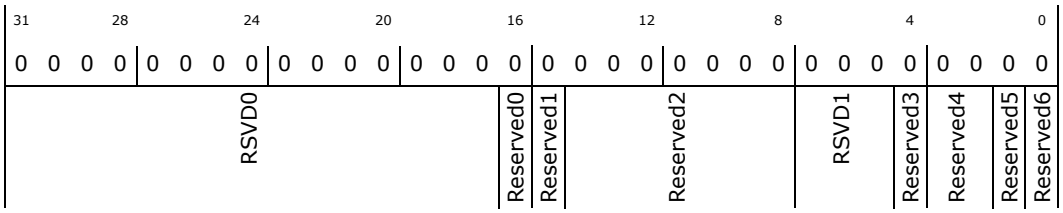
DFXREG8

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F060h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RO	**Reserved0:** reserved.
15	0x0 RO	**Reserved1:** reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:8	0x0 RO	**Reserved2:** reserved.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RO	**Reserved3:** reserved.
3:2	0x0 RO	**Reserved4:** reserved.
1	0x0 RO	**Reserved5:** reserved.
0	0x0 RO	**Reserved6:** reserved.

7.5.26 reg_DFXREG9_type (DFXREG9)—Offset F064h

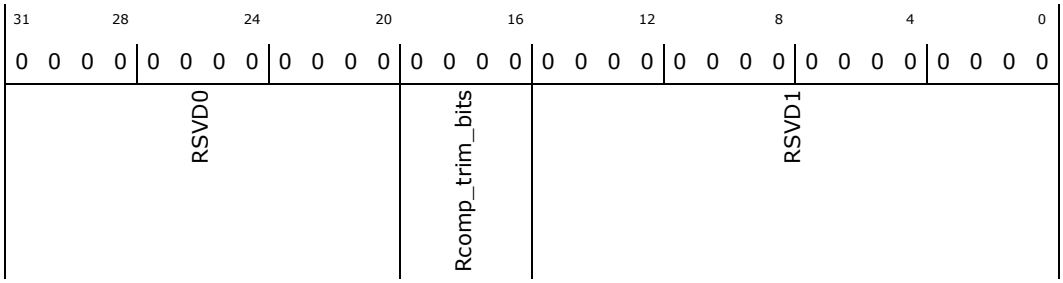
DFXREG9

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F064h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Rcomp_trim_bits:** select reference voltage for RCOMP comparator. Adjustments for +5,+10 or -5 %.
15:0	0x0 RO	**RSVD1:** Reserved

7.5.27 reg_DFXREG10_type (DFXREG10)—Offset F068h

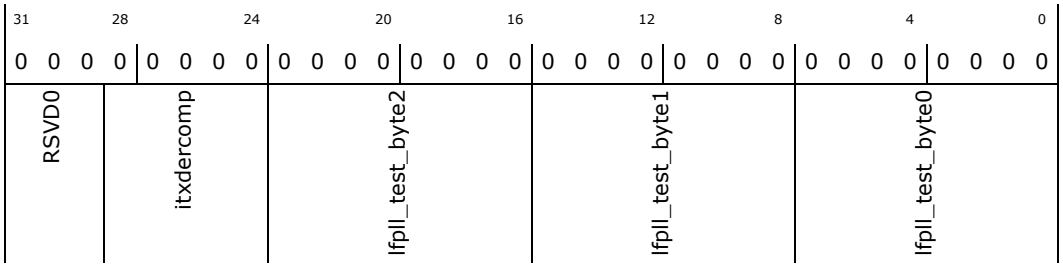
DFXREG10

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F068h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28:24	0x0 RW	**itxdercomp:** de-emphasis RCOMP codes
23:16	0x0 RW	**lfpll_test_byte2:** LFPLL Test Control Placeholder coarseovrd and fineovrd and dcoovrd[15:0] and viewsel[2:0].
15:8	0x0 RW	**lfpll_test_byte1:** LFPLL Test Control Placeholder coarseovrd and fineovrd and dcoovrd[15:0] and viewsel[2:0].
7:0	0x0 RW	**lfpll_test_byte0:** LFPLL Test Control Placeholder coarseovrd and fineovrd and dcoovrd[15:0] and viewsel[2:0].

7.5.28 reg_DFXREG11_type (DFXREG11)—Offset F06Ch

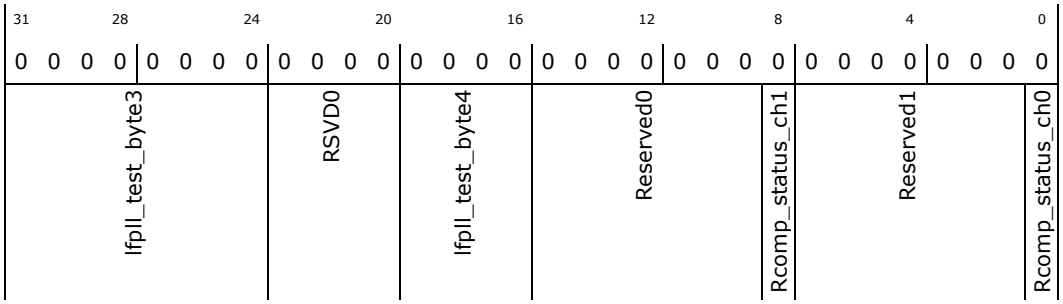
DFXREG11

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F06Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**lfpll_test_byte3:** LFPLL test placeholder.
23:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**lfpll_test_byte4:** LFPLL test placeholder.
15:9	0x0 RO	**Reserved0:** reserved.
8	0x0 RW/1C	**Rcomp_status_ch1:** Poll for 1'b1 to check if Rcomp is done. write 1 to clear.
7:1	0x0 RO	**Reserved1:** reserved.
0	0x0 RW/1C	**Rcomp_status_ch0:** Poll for 1'b1 to check if Rcomp is done. write 1 to clear.

7.5.29 reg_DFXREG12_type (DFXREG12)—Offset F070h

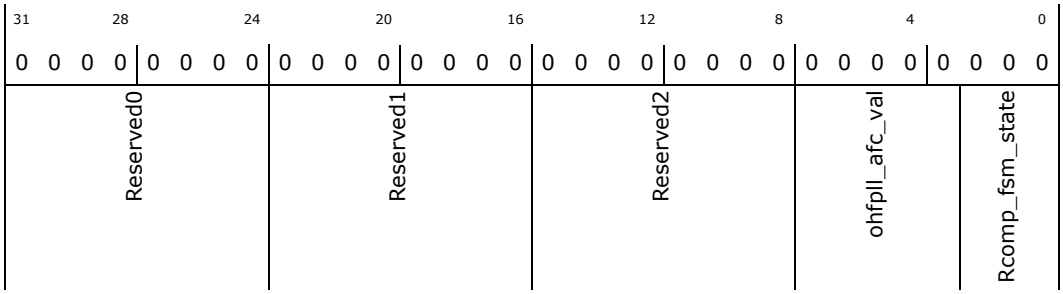
DFXREG12

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F070h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** reserved.
23:16	0x0 RO	**Reserved1:** reserved.
15:8	0x0 RO	**Reserved2:** reserved.
7:3	0x0 RO	**ohfpll_afc_val:** AFC lock values. When the AFC is enabled, the AFC value after PLL locked is captured here and can be read out for debug purposes

Bit Range	Default & Access	Field Name (ID): Description
2:0	0x0 RO	**Rcomp_fsm_state:** Read out Rcomp FSM current state. RCOMP FSM State 3'b000 = s_RCOMP_FSM_IDLE 3'b001 = s_RCOMP_CALIB_LOOP_TIMER 3'b010 = s_RCOMP_SAMPLE_UPCOUNT 3'b011 = s_RCOMP_INCR_CODE 3'b100 = s_RCOMP_FSM_DONE_TIMER OTHERS = Return to s_RCOMP_FSM_IDLE

7.5.30 reg_CMNREG17_type (CMNREG17)—Offset F074h

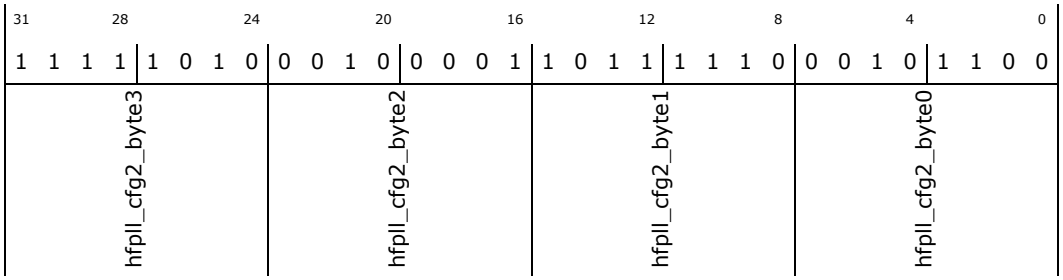
CMNREG17

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F074h

Default: FA21BE2Ch



Bit Range	Default & Access	Field Name (ID): Description
31:24	0xfa RW	**hfpll_cfg2_byte3:** HFPLL configuration register as required by AFE bits [63:32]. 19.2MHz Rate A: 0x45 19.2MHz Rate B: 0x7C 26MHz Rate A: 0xF0 26MHz Rate B: 0x18 25MHz Rate A: 0xFA 25MHz Rate B: 0x2C
23:16	0x21 RW	**hfpll_cfg2_byte2:** HFPLL configuration register as required by AFE bits [63:32]. Always 0x01
15:8	0xbe RW	**hfpll_cfg2_byte1:** HFPLL configuration register as required by AFE bits [63:32]. Always 0xAC
7:0	0x2c RW	**hfpll_cfg2_byte0:** HFPLL configuration register as required by AFE bits [63:32]. Adjust lock threshold. 0x0C normally. 0x0D during debug.

7.5.31 reg_CMNREG18_type (CMNREG18)—Offset F078h

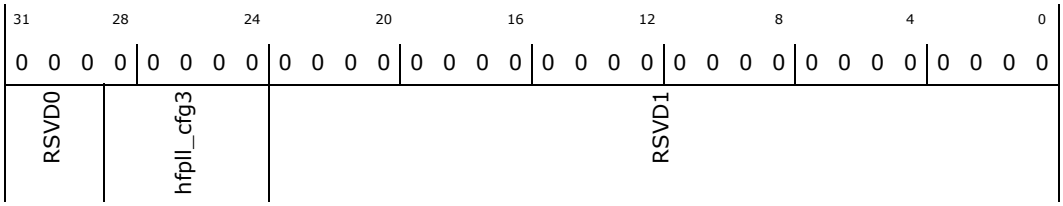
CMNREG18

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F078h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28:24	0x0 RW	**hfpll_cfg3:** HFPLL configuration register as required by AFE bits [67:64]. 19.2MHz Rate A: 0x1 19.2MHz Rate B: 0x1 26MHz Rate A: 0 26MHz Rate B: 0x1 25MHz Rate A: 0 25MHz Rate B: 0x1
23:0	0x0 RO	**RSVD1:** Reserved

7.5.32 reg_CMNREG19_type (CMNREG19)—Offset F07Ch

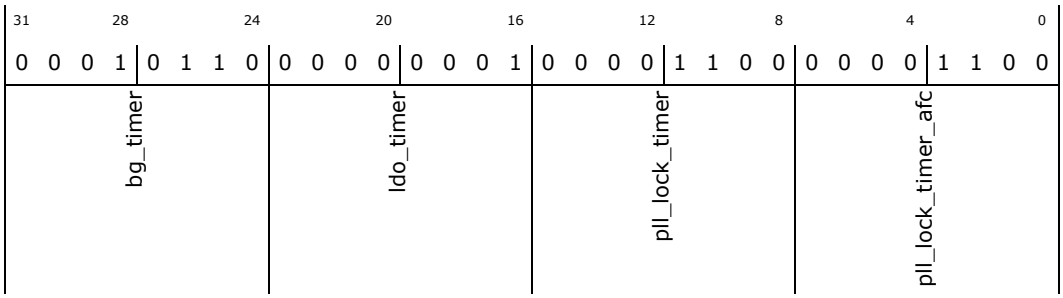
CMNREG19

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F07Ch

Default: 16010C0Ch



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x16 RW	**bg_timer:** Band gap timer. Counts in multiple of 32 reference clock cycles. Though BG is not present in ANN, the timer delay is still honored.
23:16	0x1 RW	**ldo_timer:** LDO timer. Counts in 1us granularity. Though LDO is not present in SoC, the timer delay is still honored.
15:8	0xc RW	**pll_lock_timer:** PLL lock timer without the AFC counter enabled. Counts in 1us granularity
7:0	0xc RW	**pll_lock_timer_afc:** PLL lock timer with the AFC counter enabled. Counts in 1us granularity

7.5.33 reg_CMNREG20_type (CMNREG20)—Offset F080h

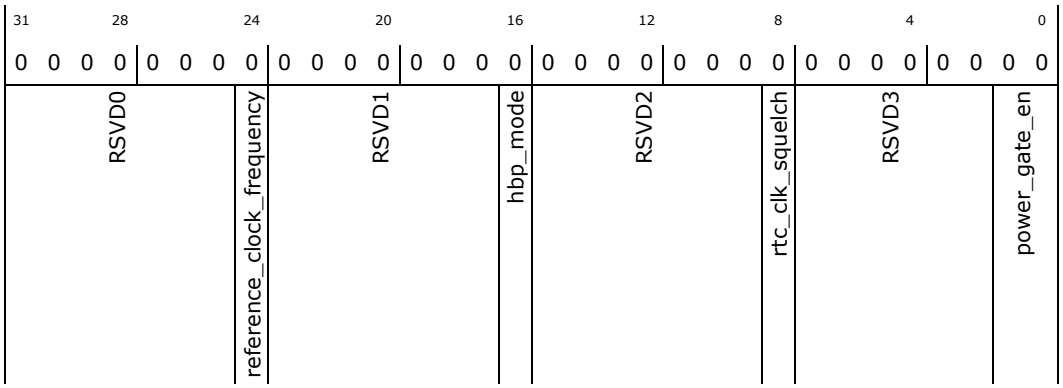
CMNREG20

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F080h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**reference_clock_frequency:** 1'b0 - 19.2 MHz reference clock;; 1'b1 - 26 MHz reference clock
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**hbp_mode:** HBP Mode clocking. The MaxHSClk will be set to 500 MHz when HBP mode is enabled. The MaxHSClk gating should be disabled in this mode.
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**rtc_clk_squelch:** The squelch detection circuit in data lane RX will use the RTC clk (32 KHz) instead of the local ring oscillator
7:2	0x0 RO	**RSVD3:** Reserved
1:0	0x0 RW	**power_gate_en:** Enable Power gating [0] - Common Lane core power gating; [1] - Common Lane SUS power gating enable.

7.5.34 reg_CMNREG21_type (CMNREG21)—Offset F084h

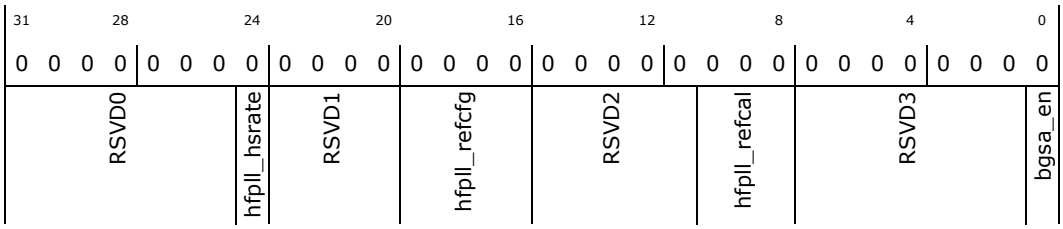
CMNREG21

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD + F000h] + F084h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**hfpll_hsrate:** 1=Rate A, 0=Rate B
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0x0 RW	**hfpll_refcfg:** NA
15:11	0x0 RO	**RSVD2:** Reserved
10:8	0x0 RW	**hfpll_refcal:** PLL Reference current amplitude select
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**bgsa_en:** Enables small amplitude mode for BG on SoC. Selects small amplitude reference voltage in voltage divider in ANN.

7.5.35 reg_CMNREG22_type (CMNREG22)—Offset F088h

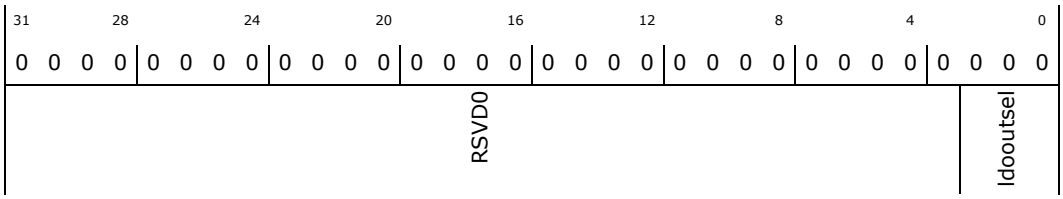
CMNREG22

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

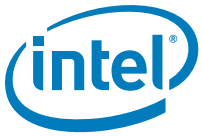
Offset: [TBD + F000h] + F088h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2:0	0x0 RW	**ldooutsel:** LDO output fine tuning setting. Step size = ~10mV.



7.6 USB3 Memory Mapped RX Registers

Table 42. Summary of Memory Mapped I/O Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
80–83h	4	"reg_RXCAPREG1_type (RXCAPREG1)—Offset 80h" on page 2953	00020100h
84–87h	4	"reg_RXCAPREG2_type (RXCAPREG2)—Offset 84h" on page 2953	0F010005h
88–8Bh	4	"reg_RXCAPREG3_type (RXCAPREG3)—Offset 88h" on page 2954	44017D08h
8C–8Fh	4	"reg_RXCAPREG4_type (RXCAPREG4)—Offset 8Ch" on page 2955	01070804h
90–93h	4	"reg_RXCAPREG5_type (RXCAPREG5)—Offset 90h" on page 2956	15010020h
94–97h	4	"reg_RXCAPREG6_type (RXCAPREG6)—Offset 94h" on page 2957	04044645h
A0–A3h	4	"reg_RXREG2_type (RXREG2)—Offset A0h" on page 2958	01020100h
A4–A7h	4	"reg_RXREG3_type (RXREG3)—Offset A4h" on page 2959	0F000001h
A8–ABh	4	"reg_RXREG4_type (RXREG4)—Offset A8h" on page 2960	00000000h
C0–C3h	4	"reg_RXREG5_type (RXREG5)—Offset C0h" on page 2961	00000000h

7.6.1 reg_RXCAPREG1_type (RXCAPREG1)—Offset 80h

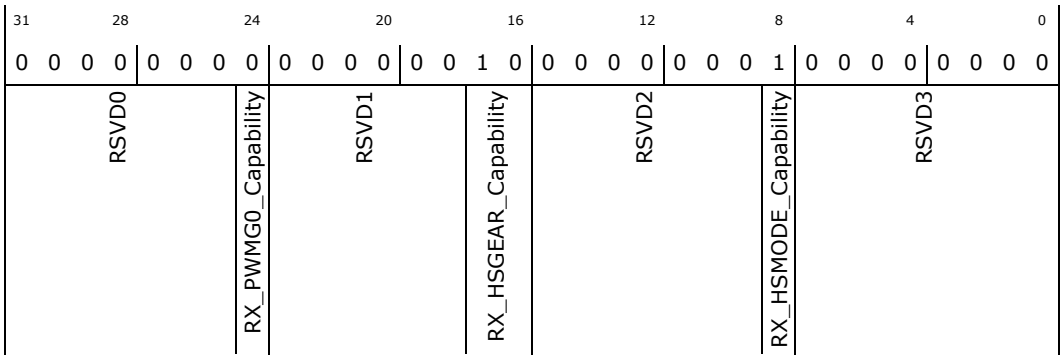
RXCAPREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 80h

Default: 00020100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**RX_PWMG0_Capability:** Specifies support for PWM-G0. NO = 0, YES = 1
23:18	0x0 RO	**RSVD1:** Reserved
17:16	0x2 RW	**RX_HSGEAR_Capability:** Specifies supported HS-GEARs. Existence depends on: RX_HSMODE_Capability HS_G1_ONLY = 1, HS_G1_TO_G2 = 2, HS_G1_TO_G3 = 3
15:9	0x0 RO	**RSVD2:** Reserved
8	0x1 RW	**RX_HSMODE_Capability:** Specifies support for HS-MODE. FALSE = 0, TRUE = 1
7:0	0x0 RO	**RSVD3:** Reserved

7.6.2 reg_RXCAPREG2_type (RXCAPREG2)—Offset 84h

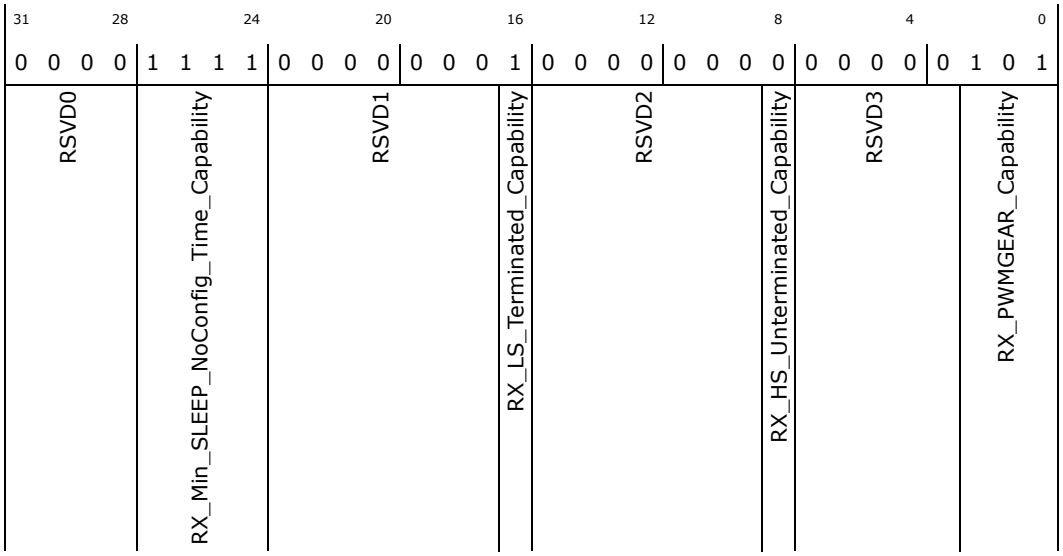
RXCAPREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 84h

Default: 0F010005h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0xf RW	**RX_Min_SLEEP_NoConfig_Time_Capability:** Specifies minimum time(in SI) in SLEEP state needed when inline configuration was not performed. 1 to 15
23:17	0x0 RO	**RSVD1:** Reserved
16	0x1 RW	**RX_LS_Terminated_Capability:** Specifies support for enabling resistive termination in LS-MODE. NO = 0, YES = 1
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**RX_HS_Unterminated_Capability:** Specifies support for disconnection of resistive termination in HS-MODE. Existence depends on: RX_HSMODE_Capability NO = 0, YES = 1
7:3	0x0 RO	**RSVD3:** Reserved
2:0	0x5 RW	**RX_PWMGEAR_Capability:** Specifies supported PWM-GEARs other than PWM-G0. PWM_G1_ONLY = 1, PWM_G1_TO_G2 = 2, PWM_G1_TO_G3 = 3, PWM_G1_TO_G4 = 4, PWM_G1_TO_G5 = 5, PWM_G1_TO_G6 = 6, PWM_G1_TO_G7 = 7

7.6.3 reg_RXCAPREG3_type (RXCAPREG3)—Offset 88h

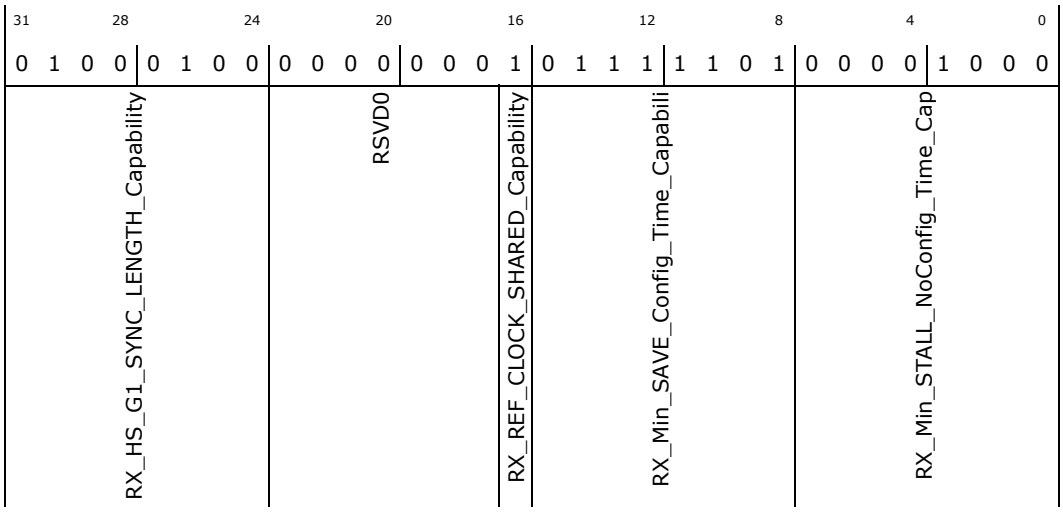
RXCAPREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 88h

Default: 44017D08h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x44 RW	**RX_HS_G1_SYNC_LENGTH_Capability:** High Speed GEAR 1 Synchronization pattern length in SI. Existence depends on: RX_HSMODE_Capability B[7:6] SYNC_range FINE = 0, COARSE = 1 B[5:0] SYNC_length 1 to 15 for FINE, 0 to 15 for COARSE
23:17	0x0 RO	**RSVD0:** Reserved
16	0x1 RW	**RX_REF_CLOCK_SHARED_Capability:** Specifies support for a shared reference clock. B[0] NO = 0, YES = 1
15:8	0x7d RW	**RX_Min_SAVE_Config_Time_Capabili:** (Spec Name, RX_Min_SAVE_Config_Time_Capability) Specifies minimum reconfiguration time (in 40 ns steps). This applies only to SLEEP and STALL states. Both Int B[7:0] 1 to 250 (10000 ns) RX_REF_CLOCK_SHARED_Capability 0x8A Specifies support for a shared reference clock. NO = 0, YES = 1
7:0	0x8 RW	**RX_Min_STALL_NoConfig_Time_Cap:** (Spec Name RX_Min_STALL_NoConfig_Time_Capability) Specifies minimum time(in SI) in STALL state needed when inline configuration was not performed. 1 to 255

7.6.4 reg_RXCAPREG4_type (RXCAPREG4)—Offset 8Ch

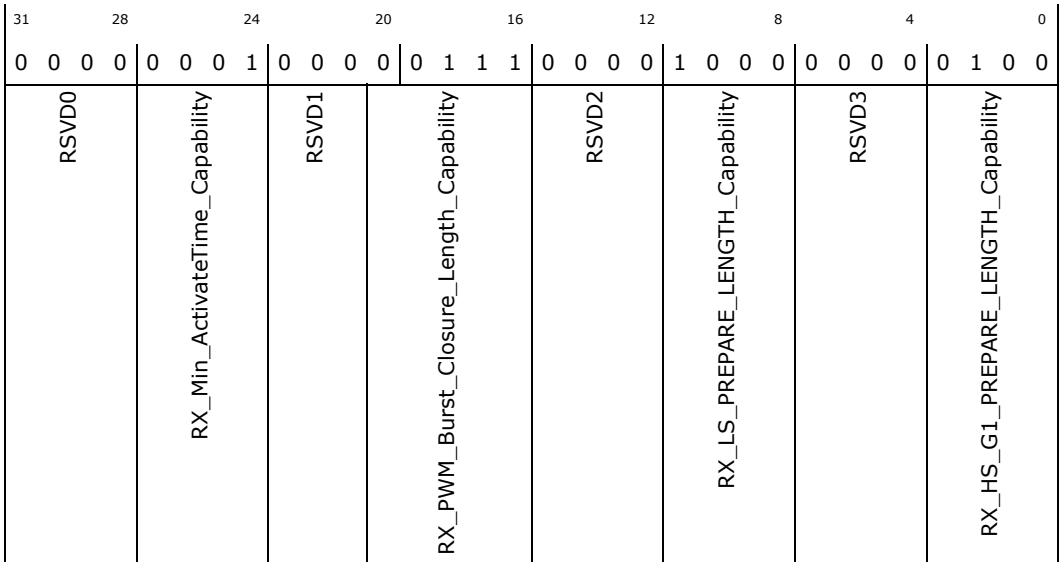
RXCAPREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 8Ch

Default: 01070804h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x1 RW	**RX_Min_ActivateTime_Capability:** Specifies minimum activate time needed in 100s steps. B[3:0] 1 to 9
23:21	0x0 RO	**RSVD1:** Reserved
20:16	0x7 RW	**RX_PWM_Burst_Closure_Length_Capability:** Specifies minimum burst closure time (in SI) necessary to guarantee complete data processing inside M-RX. B[4:0] 0 to 31
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x8 RW	**RX_LS_PREPARE_LENGTH_Capability:** PWM-BURST or SYS-BURST PREPARE length multiplier for M-RX. B[3:0]0 to 15
7:4	0x0 RO	**RSVD3:** Reserved
3:0	0x4 RW	**RX_HS_G1_PREPARE_LENGTH_Capability:** HS-G1 PREPARE length multiplier for M-RX. Existence depends on: RX_HSMODE_Capability B[3:0] 0 to 15

7.6.5 reg_RXCAPREG5_type (RXCAPREG5)—Offset 90h

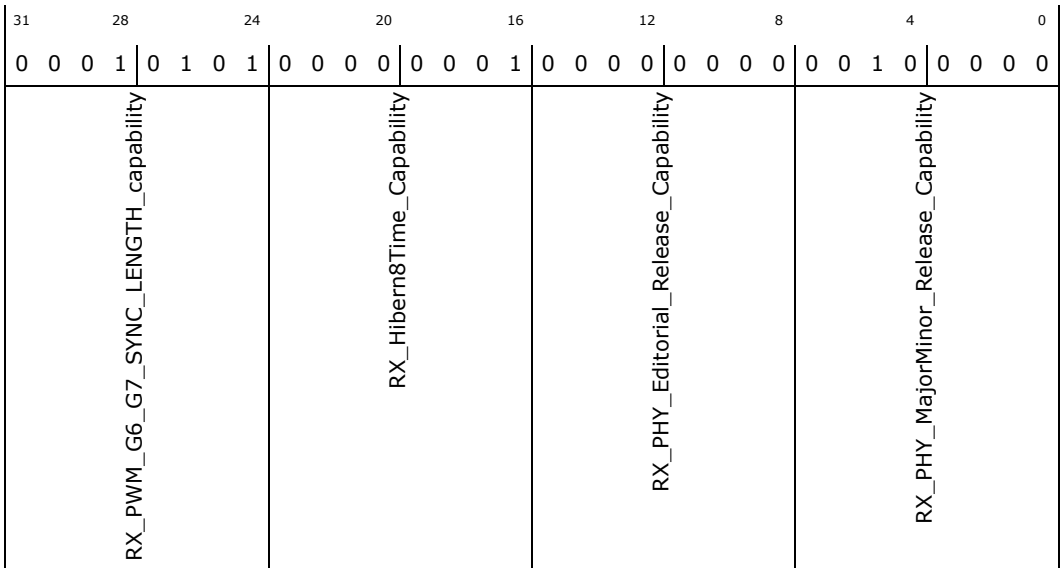
RXCAPREG5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 90h

Default: 15010020h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x15 RW	**RX_PWM_G6_G7_SYNC_LENGTH_capability:** Synchronization pattern length, in SI, for PWM-G6 and PWM-G7 in LS-MODE . Existence depends on: RX_PWMGEAR_Capability B[7:6] SYNC_range FINE = 0, COARSE = 1 B[5:0] SYNC_length 0 to 15
23:16	0x1 RW	**RX_Hibern8Time_Capability:** Specifies minimum time (in 100s steps) in HIBERN8 state. B[7:0] 1 to 128 (100s to 12.8 ms)
15:8	0x0 RW	**RX_PHY_Editorial_Release_Capability:** Specifies the sequence number of the M-PHY version supported by the M-RX. B[7:0] 1 to 99
7:0	0x20 RW	**RX_PHY_MajorMinor_Release_Capability:** Specifies the major and minor numbers of the M-PHY version supported by the M-RX. B[7:4] Major version number, 0 to 9 B[3:0] Minor version number, 0 to 9

7.6.6 reg_RXCAPREG6_type (RXCAPREG6)—Offset 94h

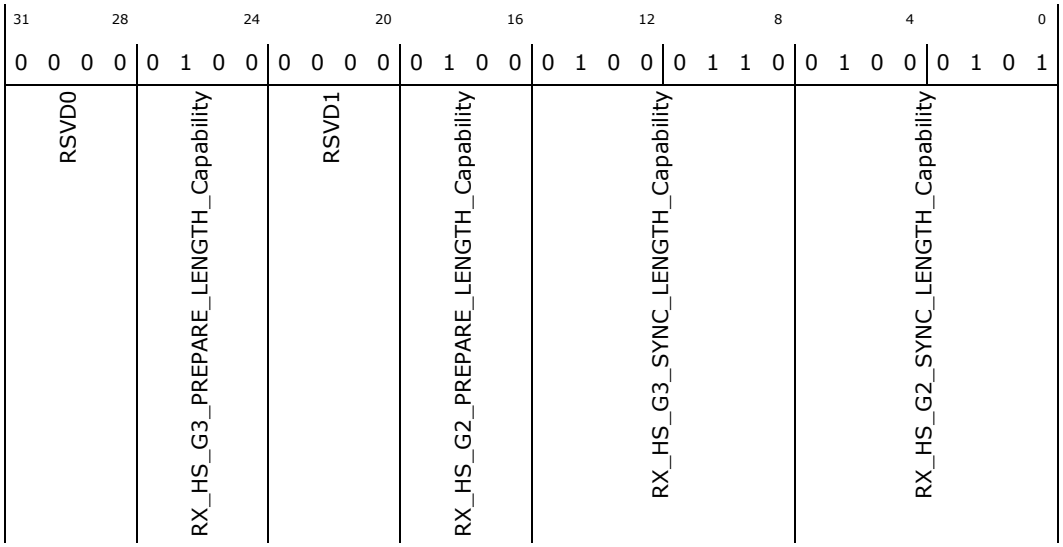
RXCAPREG6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 94h

Default: 04044645h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x4 RW	**RX_HS_G3_PREPARE_LENGTH_Capability:** HS-G3 PREPARE length multiplier for M-RX. Existence depends on: RX_HSGEAR_Capability B[3:0] 0 to 15
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0x4 RW	**RX_HS_G2_PREPARE_LENGTH_Capability:** HS-G2 PREPARE length multiplier for M-RX. Existence depends on: RX_HSGEAR_Capability B[3:0] 0 to 15
15:8	0x46 RW	**RX_HS_G3_SYNC_LENGTH_Capability:** High Speed GEAR 3Synchronization pattern length in SI. Existence depends on: RX_HSGEAR_Capability B[7:6] SYNC_range FINE = 0, COARSE = 1 B[5:0] SYNC_length 1 to 15 for FINE, 0 to 15 for COARSE
7:0	0x45 RW	**RX_HS_G2_SYNC_LENGTH_Capability:** High Speed GEAR 2 Synchronization pattern length in SI. Existence depends on: RX_HSGEAR_Capability B[7:6] SYNC_range FINE = 0, COARSE = 1 B[5:0] SYNC_length 1 to 15 for FINE, 0 to 15 for COARSE

7.6.7 reg_RXREG2_type (RXREG2)—Offset A0h

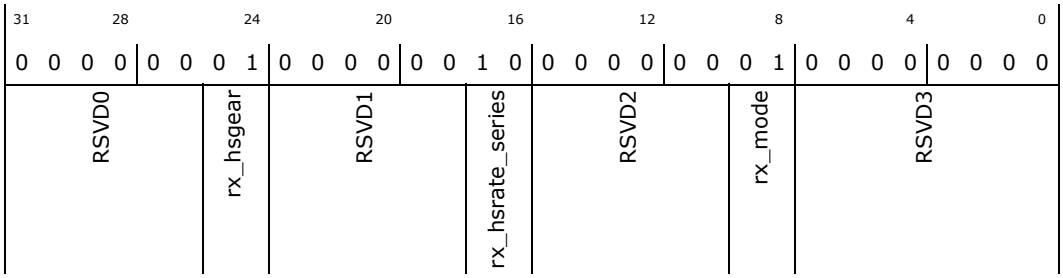
RXREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + A0h

Default: 01020100h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x1 RW	**rx_hsgear:** Current HS-GEAR. Existence depends on: RX_HSMODE_Capability Value depends on: RX_HSGEAR_Capability Reqd Value: HS_G1 Reset Value: HS_G1 B[1:0] HS_G1 = 1, HS_G2 = 2, HS_G3 = 3
23:18	0x0 RO	**RSVD1:** Reserved
17:16	0x2 RW	**rx_hsrate_series:** HS mode RATE series value. Existence depends on: RX_HSMODE_Capability Reqd Values: A and B Reset Value: A B[1:0] A = 1, B = 2
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x1 RW	**rx_mode:** Operating mode. Existence depends on: RX_HSMODE_Capability Reqd Value: LS_MODE Reset Value: LS_MODE B[1:0] LS_MODE = 1, HS_MODE = 2
7:0	0x0 RO	**RSVD3:** Reserved

7.6.8 reg_RXREG3_type (RXREG3)—Offset A4h

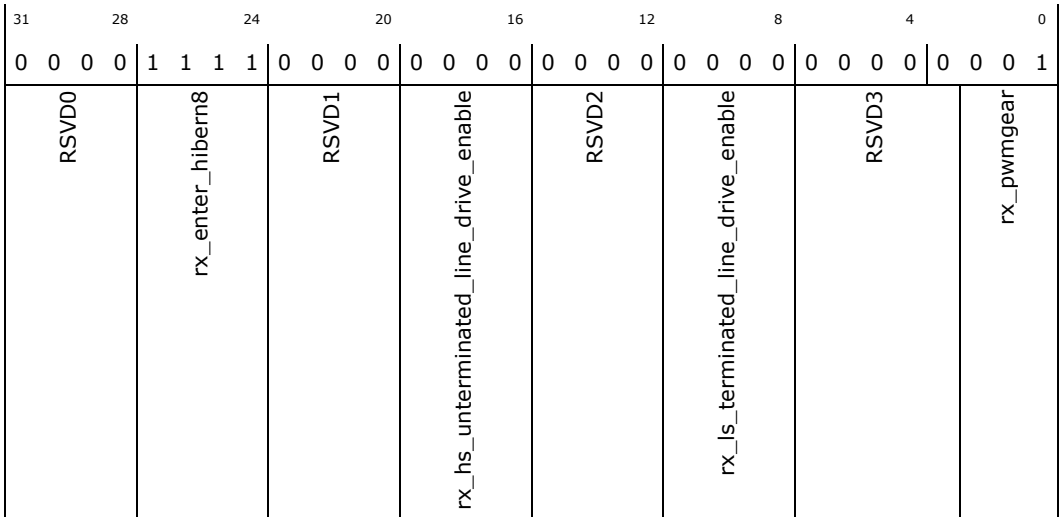
RXREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + A4h

Default: 0F000001h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0xf RW	**rx_enter_hibern8:** M-RX entry to HIBERN8 state control. Reqd Values: YES, NO Reset Value: YES for Local RESET, NO for LINE-RESET B[0] NO = 0: Protocol Layer shall not set the value of this attribute to NO. When the M-RX is in HIBERN8 state, upon squelch detection the M-RX exits HIBERN8 state (to SLEEP or STALL state) and resets this attribute value to NO, YES = 1: Can be set by the Protocol. The M-RX enters from SLEEP or STALL state to HIBERN8 state, if it is not already in HIBERN8 state.
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0x0 RW	**rx_hs_unterminated_line_drive_enable:** Reserved.

7.7 USB3 Memory Mapped TX Registers

Table 43. Summary of Memory Mapped I/O Registers—TBD

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_TXCAPREG1_type (TXCAPREG1)—Offset 0h" on page 2965	00020100h
4–7h	4	"reg_TXCAPREG2_type (TXCAPREG2)—Offset 4h" on page 2965	01010305h
8–Bh	4	"reg_TXCAPREG3_type (TXCAPREG3)—Offset 8h" on page 2966	6F080F01h
C–Fh	4	"reg_TXCAPREG4_type (TXCAPREG4)—Offset Ch" on page 2967	01002001h
20–23h	4	"reg_TXREG1_type (TXREG1)—Offset 20h" on page 2968	01020100h
24–27h	4	"reg_TXREG2_type (TXREG2)—Offset 24h" on page 2969	00000201h
28–2Bh	4	"reg_TXREG3_type (TXREG3)—Offset 28h" on page 2970	0F080444h
2C–2Fh	4	"reg_TXREG4_type (TXREG4)—Offset 2Ch" on page 2971	00000701h
30–33h	4	"reg_TXREG5_type (TXREG5)—Offset 30h" on page 2972	01000000h
40–43h	4	"reg_TXREG6_type (TXREG6)—Offset 40h" on page 2973	00000000h

7.7.1 reg_TXCAPREG1_type (TXCAPREG1)—Offset 0h

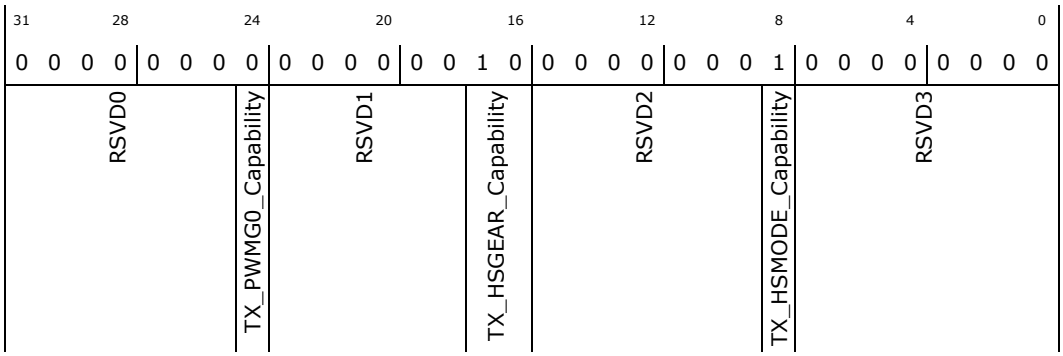
TXCAPREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 0h

Default: 00020100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**TX_PWMG0_Capability:** Specifies support for PWM-G0. NO = 0,YES = 1
23:18	0x0 RO	**RSVD1:** Reserved
17:16	0x2 RW	**TX_HSGEAR_Capability:** TX_HSGEAR_Capability 0x02 Specifies supported HS-GEARs. Existence depends on: TX_HSMODE_Capability. HS_G1_ONLY = 1, HS_G1_TO_G2 = 2, HS_G1_TO_G3 = 3
15:9	0x0 RO	**RSVD2:** Reserved
8	0x1 RW	**TX_HSMODE_Capability:** Specifies support for HS-MODE. FALSE = 0, TRUE = 1
7:0	0x0 RO	**RSVD3:** Reserved

7.7.2 reg_TXCAPREG2_type (TXCAPREG2)—Offset 4h

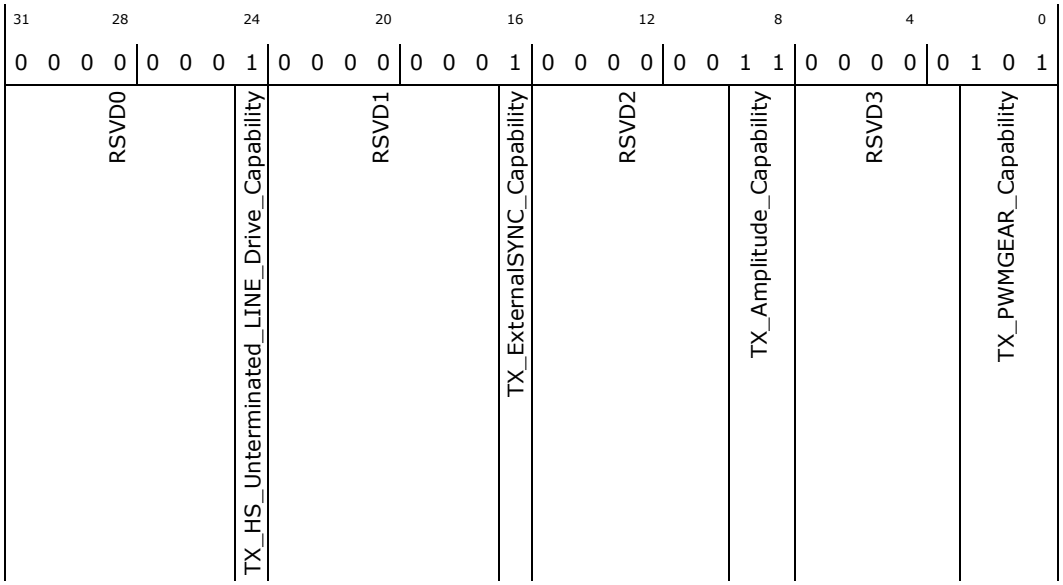
TXCAPREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 4h

Default: 01010305h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x1 RW	**TX_HS_Unterminated_LINE_Drive_Capability:** Specifies whether or not M-TX supports driving an unterminated LINE in HS-MODE. Existence depends on:TX_HSMODE_Capability. NO = 0, YES = 1
23:17	0x0 RO	**RSVD1:** Reserved
16	0x1 RW	**TX_ExternalSYNC_Capability:** Specifies support for external SYNC pattern. FALSE = 0, TRUE = 1
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x3 RW	**TX_Amplitude_Capability:** Specifies supported signal amplitude levels. SMALL_AMPLITUDE_ONLY = 1, LARGE_AMPLITUDE_ONLY = 2, LARGE_AND_SMALL_AMPLITUDE = 3
7:3	0x0 RO	**RSVD3:** Reserved
2:0	0x5 RW	**TX_PWMGEAR_Capability:** Specifies support for PWM-GEARs other than PWM-G0. PWM_G1_ONLY = 1, PWM_G1_TO_G2 = 2, PWM_G1_TO_G3 = 3, PWM_G1_TO_G4 = 4, PWM_G1_TO_G5 = 5, PWM_G1_TO_G6 = 6, PWM_G1_TO_G7 = 7

7.7.3 reg_TXCAPREG3_type (TXCAPREG3)—Offset 8h

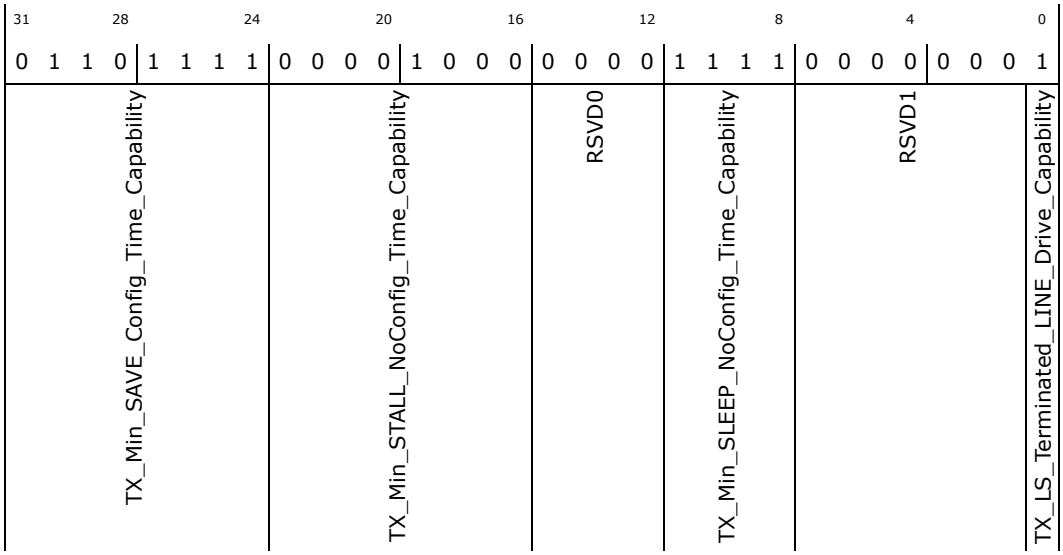
TXCAPREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 8h

Default: 6F080F01h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x6f RW	**TX_Min_SAVE_Config_Time_Capability:** Specifies minimum reconfiguration time (in 40 ns steps) plus an additional 20 SI in the GEAR from which the configuration change was initiated. This applies only to SLEEP and STALL states. 1 to 250 (10000 ns) plus an additional 20 SI
23:16	0x8 RW	**TX_Min_STALL_NoConfig_Time_Capability:** Specifies minimum time (in SI) in STALL state needed when inline configuration was not performed. 1 to 255
15:12	0x0 RO	**RSVD0:** Reserved
11:8	0xf RW	**TX_Min_SLEEP_NoConfig_Time_Capability:** Specifies minimum time (in SI) in SLEEP state needed when inline configuration was not performed. 1 to 15
7:1	0x0 RO	**RSVD1:** Reserved
0	0x1 RW	**TX_LS_Terminated_LINE_Drive_Capability:** Specifies whether or not M-TX supports driving a terminated LINE in LS-MODE. NO = 0, YES = 1

7.7.4 reg_TXCAPREG4_type (TXCAPREG4)—Offset Ch

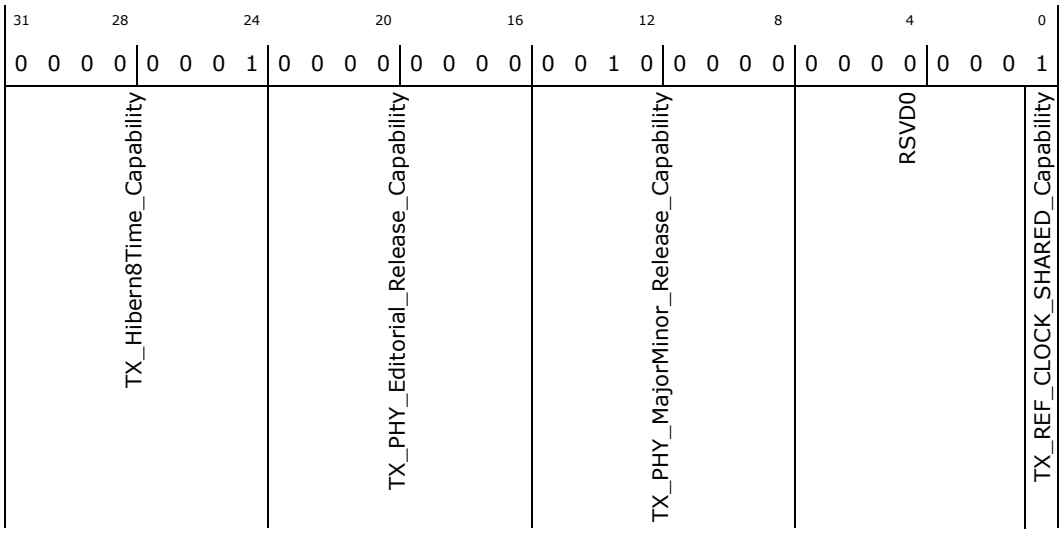
TXCAPREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + Ch

Default: 01002001h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x1 RW	**TX_Hibern8Time_Capability:** Specifies minimum time (in 100s steps) in HIBERN8 state. B[7:0] 1 to 128 (100s to 12.8 ms)
23:16	0x0 RW	**TX_PHY_Editorial_Release_Capability:** Specifies the sequence number of the M-PHY version supported by the M-TX. Both Int B[7:0] 1 to 99
15:8	0x20 RW	**TX_PHY_MajorMinor_Release_Capability:** Specifies the major and minor numbers of the M-PHY version supported by the M-TX. B[7:4] Major version number, 0 to 9 B[3:0] Minor version number, 0 to 9
7:1	0x0 RO	**RSVD0:** Reserved
0	0x1 RW	**TX_REF_CLOCK_SHARED_Capability:** Specifies support for a shared reference clock. NO = 0, YES = 1

7.7.5 reg_TXREG1_type (TXREG1)—Offset 20h

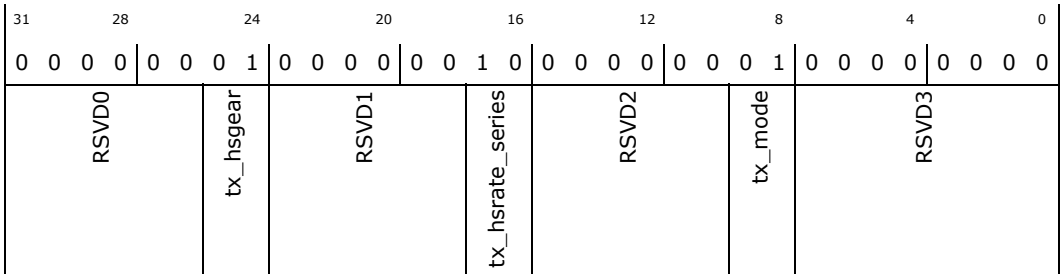
TXREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 20h

Default: 01020100h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x1 RW	**tx_hsgear:** HS-GEAR value of M-TX. Existence depends on: TX_HSMODE_Capability Value depends on: TX_HSGEAR_Capability Reqd Value: HS_G1 Reset Value: HS_G1 HS_G1 = 1, HS_G2 = 2, HS_G3 = 3
23:18	0x0 RO	**RSVD1:** Reserved
17:16	0x2 RW	**tx_hsrate_series:** HS mode RATE series value of M-TX. Existence depends on: TX_HSMODE_Capability Reqd Value: A and B Reset Value: A A = 1, B = 2
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x1 RW	**tx_mode:** M-TX operating mode. Existence depends on: TX_HSMODE_Capability Reqd Value: LS_MODE Reset Value: LS_MODE LS_MODE = 1, HS_MODE = 2
7:0	0x0 RO	**RSVD3:** Reserved

7.7.6 reg_TXREG2_type (TXREG2)—Offset 24h

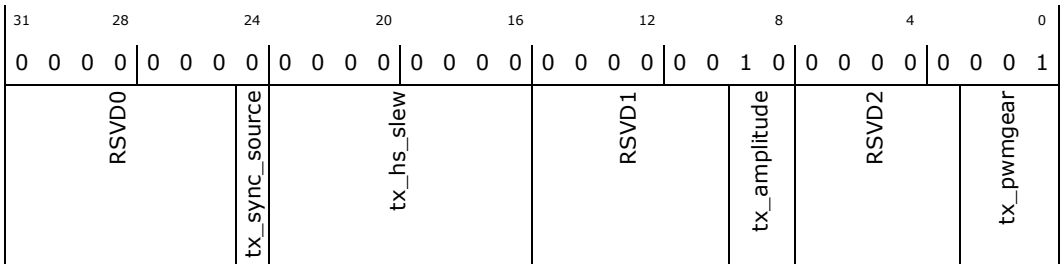
TXREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 24h

Default: 00000201h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**tx_sync_source:** Source of synchronization pattern at M-TX. Existence depends on: (TX_HSMODE_Capability OR TX_PWMGEAR_Capability = 6 OR TX_PWMGEAR_Capability = 7) AND TX_ExternalSync_Capability Reqd Value:INTERNAL_SYNC Reset Value:INTERNAL_SYNC INTERNAL_SYNC = 0, EXTERNAL_SYNC = 1
23:16	0x0 RW	**tx_hs_slew:** (Spec Name, TX_HS_SlewRate) Slew Rate control of M-TX output driver. Existence depends on: TX_HSMODE_Capability 0 to 255
15:10	0x0 RO	**RSVD1:** Reserved
9:8	0x2 RW	**tx_amplitude:** Type of drive strength on PINs at M-TX. Value depends on: TX_Amplitude_Capability Reset Value:LARGE_AMPLITUDE 1 SMALL_AMPLITUDE = 1, LARGE_AMPLITUDE = 2
7:3	0x0 RO	**RSVD2:** Reserved
2:0	0x1 RW	**tx_pwmgear:** PWM-GEAR value of M-TX. Value depends on: TX_PWMGEAR_Capability, TX_PWMG0_Capability Reqd Value: PWM_G1 Reset Value: PWM_G1 PWM_G0 = 0, PWM_G1 = 1, PWM_G2 = 2, PWM_G3 = 3, PWM_G4 = 4, PWM_G5 = 5, PWM_G6 = 6, PWM_G7 = 7

7.7.7 reg_TXREG3_type (TXREG3)—Offset 28h

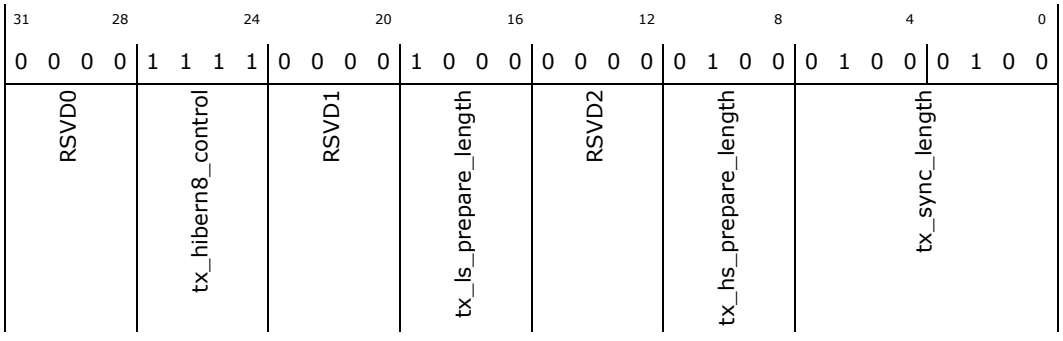
TXREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 28h

Default: 0F080444h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
27:24	0xf RW	**tx_hibern8_control:** M-TX HIBERN8 state control. 1 bit per lane for 4 lanes (EXIT = 0, ENTER = 1)
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0x8 RW	**tx_ls_prepare_length:** PWM-BURST or SYS-BURST PREPARE length multiplier for M-TX. Reqd Values: 0 to 15 Reset Value: 10 0 to 15
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x4 RW	**tx_hs_prepare_length:** HS PREPARE length multiplier for M-TX. Existence depends on: TX_HSMODE_Capability Reqd Values: 0 to 15 Reset Value: 15 0 to 15
7:0	0x44 RW	**tx_sync_length:** High Speed Synchronization pattern length of M-TX in SI. B[7:6] - 2'h0 Fine: 2'h1 Coarse: B[5:0] - Sync Length

7.7.8 reg_TXREG4_type (TXREG4)—Offset 2Ch

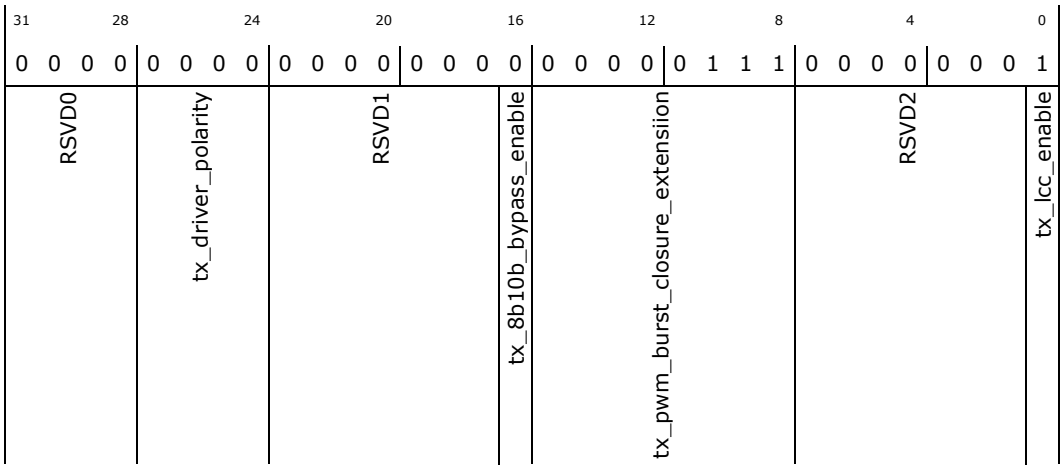
TXREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 2Ch

Default: 00000701h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x0 RW	**tx_driver_polarity:** M-TX output driver polarity. Reqd Values: NORMAL, INVERTED Reset Value: NORMAL for local RESET. LINE-RESET shall not reset the value of this attribute. NORMAL = 0, INVERTED = 1

Bit Range	Default & Access	Field Name (ID): Description
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**tx_8b10b_bypass_enable:** (Spec Name, TX_BYPASS_8B10B_Enable) Bypass 8b10b encoding operation at M-TX. Reqd Value: FALSE Reset Value: FALSE FALSE = 0, TRUE = 1
15:8	0x7 RW	**tx_pwm_burst_closure_extensiion:** (Spec Name, TX_PWM_BURST_Closure_Extension) BURST CLOSURE sequence duration in SI. The value shall be greater than, or equal to, the value of RX_PWM_Burst_Closure_Length_Capability. Reqd Values: 0 to 255 Reset Value: 32 0 to 255
7:1	0x0 RO	**RSVD2:** Reserved
0	0x1 RW	**tx_lcc_enable:** LCCs support by the M-TX. Reqd Values: YES, NO Reset Value: YES NO = 0, YES = 1

7.7.9 reg_TXREG5_type (TXREG5)—Offset 30h

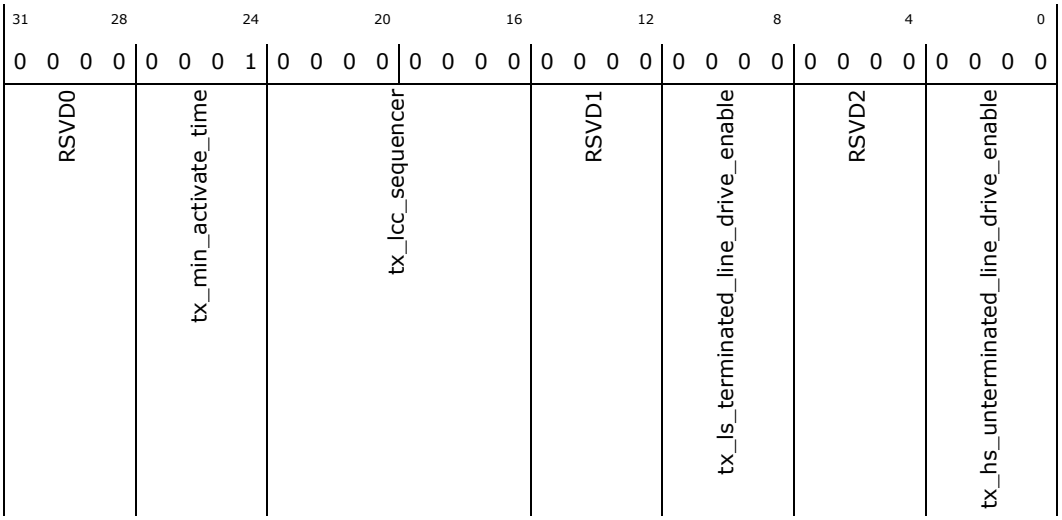
TXREG5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 30h

Default: 01000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
27:24	0x1 RW	**tx_min_activate_time:** (Spec Name TX_Min_ActivateTime) Specifies minimum activate time needed in 100 s steps. If an OMC is not present, this value must be greater than or equal to the smaller of RX_Min_ActivateTime_Capability or RX_Advanced_Min_ActivateTime_ Capability from the remote M-RX. If an OMC is present, this value must be greater than or equal to the smaller of RX_Min_ActivateTime_Capability + 1 (i.e., the Protocol Layer shall add 100 s when an OMC is present) or RX_Advanced_Min_ActivateTime_Capability + 100 ms. Reset Values: 15 1 to 15
23:16	0x0 RW	**tx_lcc_sequencer:** To set bits for carrying out multiple LCC-READ or LCC-WRITE operations. To perform an LCC operation the corresponding bit for this attribute shall be set. TX_LCC_Sequencer bits are cleared by M-TX when it issues the associated LCC request. Reqd Values: READ-CAPABILITY, READ-MFG-INFO, READ-VEND-INFO, WRITE-ATTRIBUTE Reset Values: 0 (no READ or WRITE operation requested) B[0] = 1: LCC READ-CAPABILITY requested, B[0] = 0: LCC READ-CAPABILITY not requested, B[1] = 1: LCC READ-MFG-INFO requested, B[1] = 0: LCC READ-MFG-INFO not requested, B[2] = 1: LCC READ-VEND-INFO requested, B[2] = 0: LCC READ-VEND-INFO not requested, B[6:3]: Reserved and shall be set to 0b0000, B[7] = 1: LCC WRITE-ATTRIBUTE requested, B[7] = 0: LCC WRITE-ATTRIBUTE not requested.
15:12	0x0 RO	**RSVD1:** Reserved
11:8	0x0 RW	**tx_ls_terminated_line_drive_enable:** Enable M-TX to drive terminated LINE in LS-MODE. Existence depends on: TX_LS_Terminated_LINE_Drive_Capability Reqd Values: NO, YES Reset Value: NO NO = 0, YES = 1
7:4	0x0 RO	**RSVD2:** Reserved
3:0	0x0 RW	**tx_hs_unterminated_line_drive_enable:** Enable M-TX to drive unterminated LINE in HS-MODE. Existence depends on: TX_HSMODE_Capability AND TX_HS_Unterminated_LINE_Drive_Capability Reqd Values: NO, YES Reset Value: NO NO = 0, YES = 1

7.7.10 reg_TXREG6_type (TXREG6)—Offset 40h

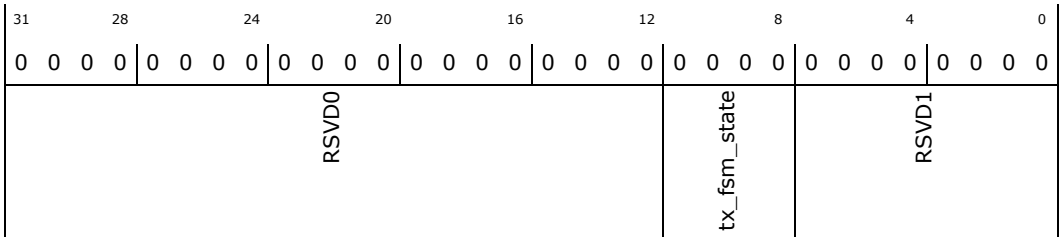
TXREG6

Access Method

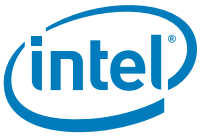
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 40h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO	**tx_fsm_state:** To read out the current state of M-TX DISABLED = 0, HIBERN8 = 1, SLEEP = 2, STALL = 3, LS-BURST = 4, HS-BURST = 5, LINE-CFG = 6 LINE-RESET = 7
7:0	0x0 RO	**RSVD1:** Reserved



7.8 USB3 Memory Mapped Private Registers

Table 44. Summary of Memory Mapped I/O Registers—TBD

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1000–1003h	4	"reg_IMPREG1_type (IMPREG1)—Offset 1000h" on page 2977	00000000h
1004–1007h	4	"reg_IMPREG2_type (IMPREG2)—Offset 1004h" on page 2977	00000000h
1008–100Bh	4	"reg_IMPREG3_type (IMPREG3)—Offset 1008h" on page 2978	FFFF0000h
100C–100Fh	4	"reg_IMPREG4_type (IMPREG4)—Offset 100Ch" on page 2979	10000000h
1010–1013h	4	"reg_IMPREG5_type (IMPREG5)—Offset 1010h" on page 2980	0000020Fh
1014–1017h	4	"reg_IMPREG6_type (IMPREG6)—Offset 1014h" on page 2981	001E0A00h
1018–101Bh	4	"reg_IMPREG7_type (IMPREG7)—Offset 1018h" on page 2981	00030008h
101C–101Fh	4	"reg_IMPREG8_type (IMPREG8)—Offset 101Ch" on page 2982	00000000h
1020–1023h	4	"reg_IMPREG9_type (IMPREG9)—Offset 1020h" on page 2983	00000000h
1024–1027h	4	"reg_IMPREG10_type (IMPREG10)—Offset 1024h" on page 2984	00000000h
1028–102Bh	4	"reg_IMPREG11_type (IMPREG11)—Offset 1028h" on page 2984	0000FFFFh
102C–102Fh	4	"reg_IMPREG12_type (IMPREG12)—Offset 102Ch" on page 2985	0A000000h
1030–1033h	4	"reg_IMPREG13_type (IMPREG13)—Offset 1030h" on page 2986	00000000h
1034–1037h	4	"reg_IMPREG14_type (IMPREG14)—Offset 1034h" on page 2987	00000000h
1038–103Bh	4	"reg_IMPREG15_type (IMPREG15)—Offset 1038h" on page 2988	00000000h
103C–103Fh	4	"reg_IMPREG16_type (IMPREG16)—Offset 103Ch" on page 2988	00000000h
1040–1043h	4	"reg_IMPREG17_type (IMPREG17)—Offset 1040h" on page 2989	00000000h
1044–1047h	4	"reg_IMPREG18_type (IMPREG18)—Offset 1044h" on page 2990	00000000h
1048–104Bh	4	"reg_IMPREG19_type (IMPREG19)—Offset 1048h" on page 2991	00000000h
104C–104Fh	4	"reg_IMPREG20_type (IMPREG20)—Offset 104Ch" on page 2992	00000000h
1050–1053h	4	"reg_IMPREG21_type (IMPREG21)—Offset 1050h" on page 2992	000F0000h
1054–1057h	4	"reg_IMPREG22_type (IMPREG22)—Offset 1054h" on page 2993	00020000h
1058–105Bh	4	"reg_IMPREG23_type (IMPREG23)—Offset 1058h" on page 2994	00000000h
105C–105Fh	4	"reg_IMPREG24_type (IMPREG24)—Offset 105Ch" on page 2995	00000000h
1060–1063h	4	"reg_IMPREG25_type (IMPREG25)—Offset 1060h" on page 2996	00000020h

7.8.1 reg_IMPREG1_type (IMPREG1)—Offset 1000h

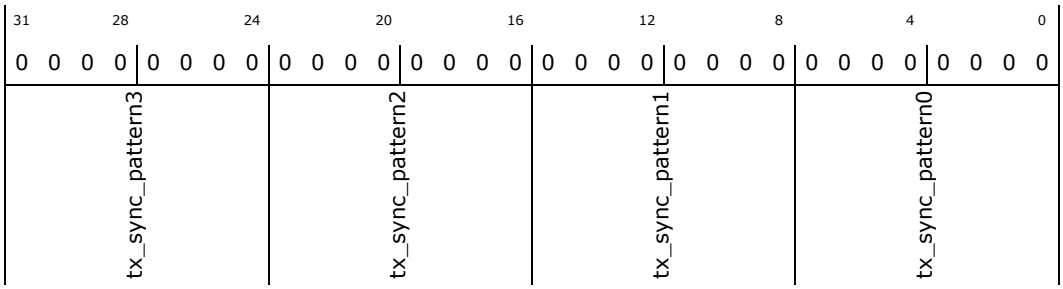
IMPREG1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1000h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**tx_sync_pattern3:** User Specified SYNC patterns. The sync pattern is 4 bytes. 8b10b data encoding is done in HW
23:16	0x0 RW	**tx_sync_pattern2:** Refer Above
15:8	0x0 RW	**tx_sync_pattern1:** Refer Above
7:0	0x0 RW	**tx_sync_pattern0:** Refer Above

7.8.2 reg_IMPREG2_type (IMPREG2)—Offset 1004h

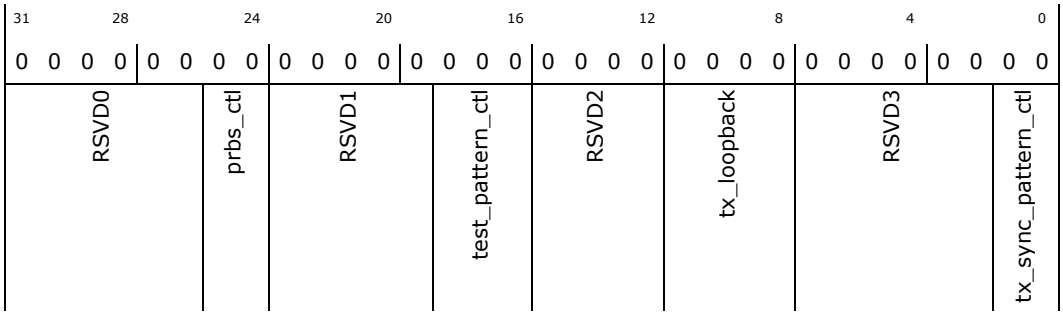
IMPREG2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1004h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x0 RW	**prbs_ctl:** 2'h0: Disable PRBS Generation 2'h1: PRBS Generation enable.
23:19	0x0 RO	**RSVD1:** Reserved
18:16	0x0 RW	**test_pattern_ctl:** B[2]: PRBS Pattern Generation B[1:0]: CJTPAT/CRPAT Pattern generation
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x0 RW	**tx_loopback:** TX2RX loopback in MPHY digital. 1 bit per lane. Supports upto 4 lanes
7:2	0x0 RO	**RSVD3:** Reserved
1:0	0x0 RW	**tx_sync_pattern_ctl:** Defines source of the SYNC Pattern 2'b00 : D10.5, D26.5 2'bX1 : tx_sync_pattern3, tx_sync_pattern2, tx_sync_pattern1, tx_sync_pattern0 2'b10 : 16'h0000

7.8.3 reg_IMPREG3_type (IMPREG3)—Offset 1008h

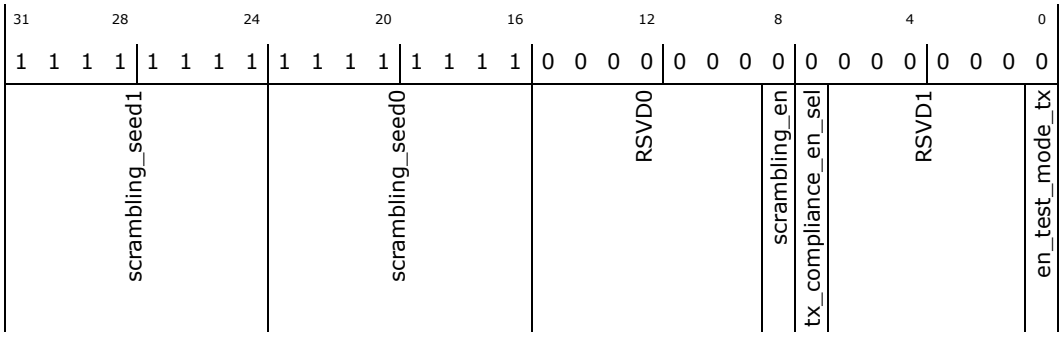
IMPREG3

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1008h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0xff RW	**scrambling_seed1:** Higher 8 bits of LFSR initial value. When test mode is enabled, burst will be sent with data from LFSR register (which is internal to design).

Bit Range	Default & Access	Field Name (ID): Description
23:16	0xff RW	**scrambling_seed0:** Lower 8 bits of LFSR initial value. When test mode is enabled, burst will be sent with data from LFSR register (which is internal to design).
15:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RW	**scrambling_en:** Enables and disables scrambling of the 16 bit data from the controller. 1'b0 : No Data Scrambling 1'b1 : Enable Data Scrambling
7	0x0 RW	**tx_compliance_en_sel:** Used as part of the MPHY TEST for SSIC. Setting this bit to a 1, will select the top level hc_mphy_test_tx_compli_en, otherwise it will select bit0 of IMPREG3.
6:1	0x0 RO	**RSVD1:** Reserved
0	0x0 RW	**en_test_mode_tx:** Enables test mode operation. Setting this bit 1, will make M-TX to start new burst with LFSR data. Hibern8/Sleep/Stall state will be exited.

7.8.4 reg_IMPREG4_type (IMPREG4)—Offset 100Ch

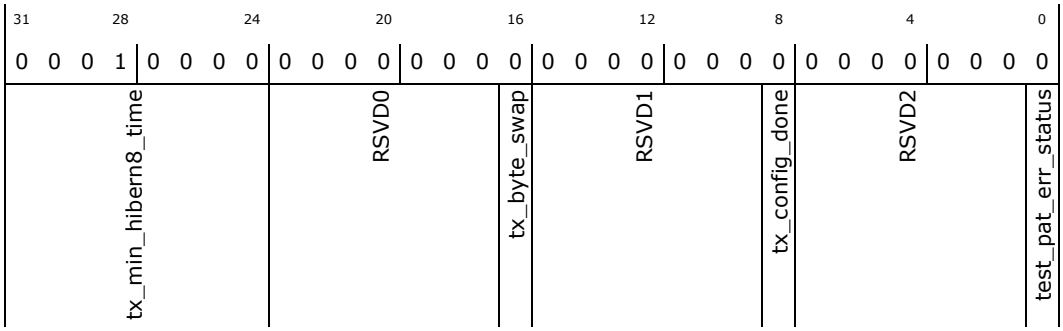
IMPREG4

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 100Ch

Default: 10000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x10 RW	**tx_min_hibern8_time:** Min time in hibern8 in terms of no of reference clocks.
23:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RW	**tx_byte_swap:** Swap the byte ordering for the pair of bytes on RMMI.

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**tx_config_done:** Indicates completion of configuration writes
7:1	0x0 RO	**RSVD2:** Reserved
0	0x0 RW/1C	**test_pat_err_status:** Error detected on LFSR pattern checking. This is set on the first mismatch.

7.8.5 reg_IMPREG5_type (IMPREG5)—Offset 1010h

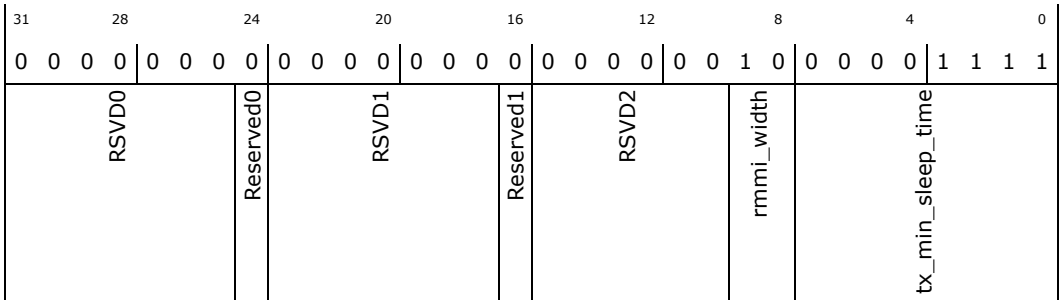
IMPREG5

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1010h

Default: 0000020Fh



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RO	**Reserved0:** Reserved
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RO	**Reserved1:** Reserved
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x2 RW	**rmmi_width:** RMMI interface width. 2'b00 : Reserved; 2'b01: 2 Symbol (16 bits); 2'h2 4 Symbols (32 bits); 2'b11 : Reserved
7:0	0xf RW	**tx_min_sleep_time:** Min time in sleep in terms of no of reference clocks.

7.8.6 reg_IMPREG6_type (IMPREG6)—Offset 1014h

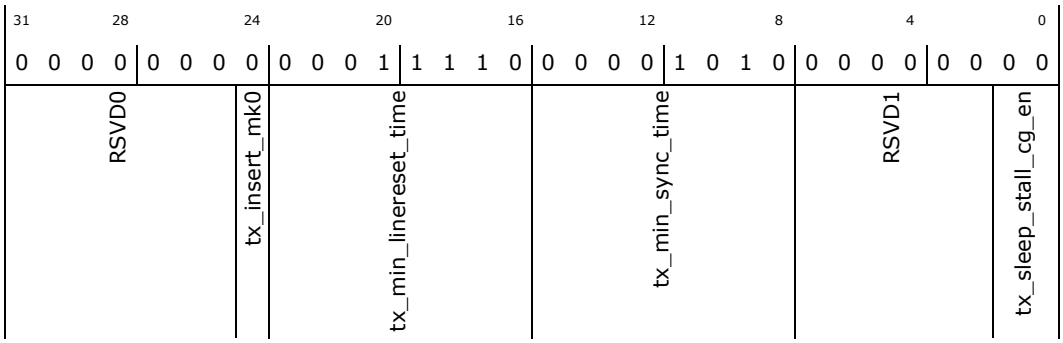
IMPREG6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1014h

Default: 001E0A00h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**tx_insert_mk0:** Insert MK0 after sync duration when starting a new burst
23:16	0x1e RW	**tx_min_linereset_time:** Drive DIF-P for this duration on line reset in steps of 100s
15:8	0xa RW	**tx_min_sync_time:** NO CONNECT
7:2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW	**tx_sleep_stall_cg_en:** Enable TX Symbol clock Gating: [0] Sleep state clock gating; [1] Stall state clock gating

7.8.7 reg_IMPREG7_type (IMPREG7)—Offset 1018h

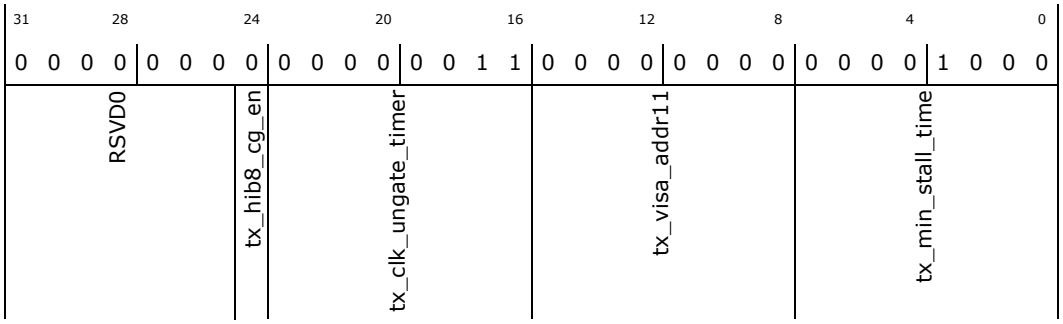
IMPREG7

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1018h

Default: 00030008h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**tx_hib8_cg_en:** Enable TX Symbol clock gating in HIBERN8 state.
23:16	0x3 RW	**tx_clk_ungate_timer:** NO CONNECT
15:8	0x0 RW	**tx_visa_addr11:** NO CONNECT
7:0	0x8 RW	**tx_min_stall_time:** Delay starting a new high burst to satisfy the tx minimum stal requirement.

7.8.8 reg_IMPREG8_type (IMPREG8)—Offset 101Ch

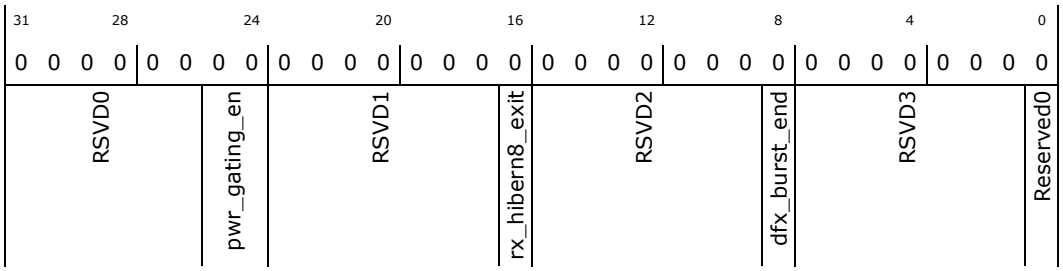
IMPREG8

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 101Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:24	0x0 RW	**pwr_gating_en:** Enable Power gating [0] : Enable Power gating feature for data lane core power well [1]: Enable power gating feature for data lane SUS power well
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**rx_hibern8_exit:** SW controlled RX H8 mechanism. Programming this bit to 1 brinss the RX out of H8. It does not wait for DIF-N detection
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**dfx_burst_end:** Force close the TX burst. This is not an offline register. Programming this register has an immediate effect.
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RO	**Reserved0:** Reserved

7.8.9 reg_IMPREG9_type (IMPREG9)—Offset 1020h

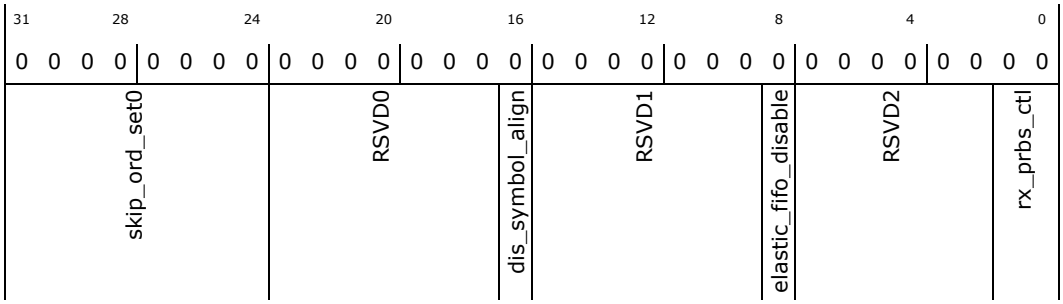
IMPREG9

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1020h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**skip_ord_set0:** Not Used
23:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RW	**dis_symbol_align:** NO CONNECT
15:9	0x0 RO	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 RW	**elastic_fifo_disable:** Disable Elastic FIFO Feature. In this mode, it acts as clock domain crossing FIFO only.
7:2	0x0 RO	**RSVD2:** Reserved
1:0	0x0 RW	**rx_prbs_ctl:** NO CONNECT

7.8.10 reg_IMPREG10_type (IMPREG10)—Offset 1024h

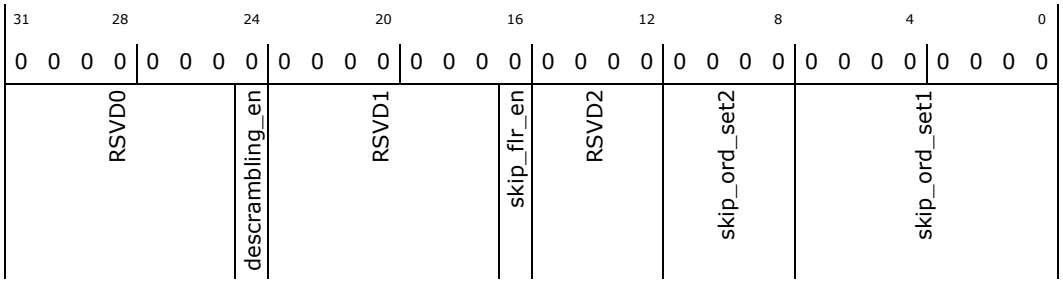
IMPREG10

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1024h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**descrambling_en:** NO CONNECT
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**skip_flr_en:** Not Used
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x0 RW	**skip_ord_set2:** Not Used
7:0	0x0 RW	**skip_ord_set1:** Not Used

7.8.11 reg_IMPREG11_type (IMPREG11)—Offset 1028h

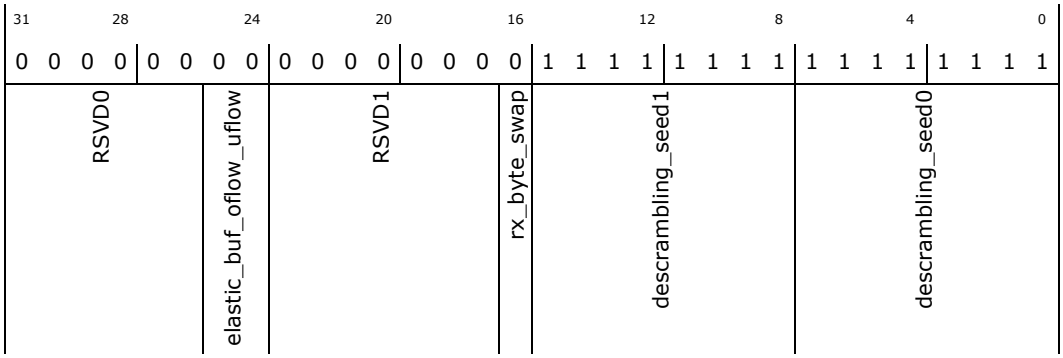
IMPREG11

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1028h

Default: 0000FFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x0 RW/1C	**elastic_buf_oflow_uflow:** Elastic Buffer overflow/underflow indication [0] - EB Overflow; [1] - EB Underflow
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**rx_byte_swap:** 1'b0 : Maintain Symbol Order 1'b1 : Swap Most Significan and Least Significant Symbols in a 20 bit Word
15:8	0xff RW	**descrambling_seed1:** De-Scrambling Seed. Reset to this value on detection of MK0
7:0	0xff RW	**descrambling_seed0:** Same as above. Part of 16 bit value

7.8.12 reg_IMPREG12_type (IMPREG12)—Offset 102Ch

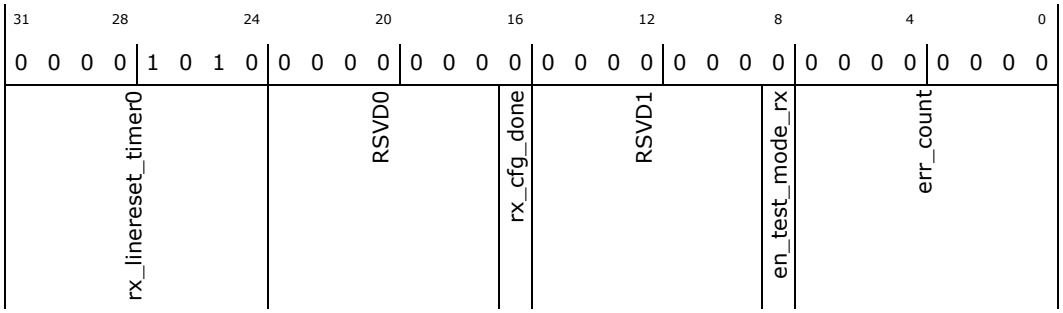
IMPREG12

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 102Ch

Default: 0A000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0xa RW	**rx_linereset_timer0:** Indicate RX_Line_reset on detection DIF-P for this duration in steps of 100s
23:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RW	**rx_cfg_done:** Indicates completion of configuration writes.
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**en_test_mode_rx:** Enables RX PRBS Pattern Test Mode 1'b0 : Test Mode Disabled 1'b1 : Test Mode Enabled
7:0	0x0 RW/1C	**err_count:** Saturatin error count. Count is incremented by 1 for each cycle there is a mismatch

7.8.13 reg_IMPREG13_type (IMPREG13)—Offset 1030h

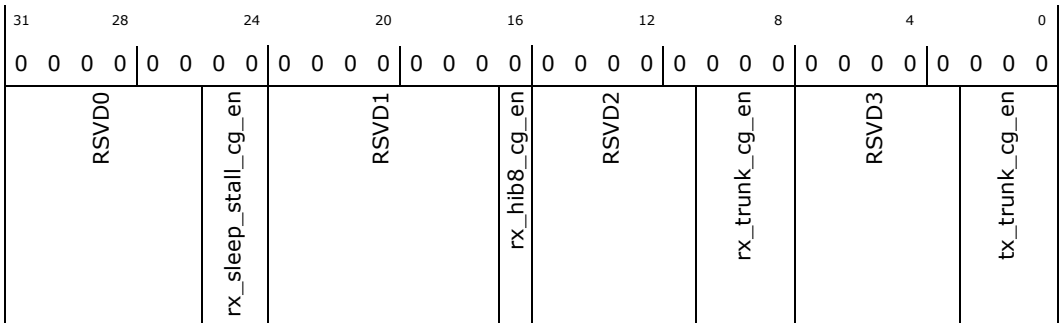
IMPREG13

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1030h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x0 RW	**rx_sleep_stall_cg_en:** Enable RX Symbol clock Gating: [0] Sleep state clock gating; [1] Stall state clock gating
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**rx_hib8_cg_en:** Enable RX Symbol clock gating in HIBERN8 state.
15:11	0x0 RO	**RSVD2:** Reserved
10:8	0x0 RW	**rx_trunk_cg_en:** RX Symbol Clock trunk clock gating enable in different states. [0] Enable RXSymbolClk gating in Sleep state; [1] Enable RXSymbolClk gating in STALL state; [2] Enable RXSymbolClk gating in HIBERN8 state.
7:3	0x0 RO	**RSVD3:** Reserved
2:0	0x0 RW	**tx_trunk_cg_en:** TX Symbol Clock trunk clock gating enable in different states. [0] Enable TXSymbolClk gating in Sleep state; [1] Enable TXSymbolClk gating in STALL state; [2] Enable TXSymbolClk gating in HIBERN8 state.

7.8.14 reg_IMPREG14_type (IMPREG14)—Offset 1034h

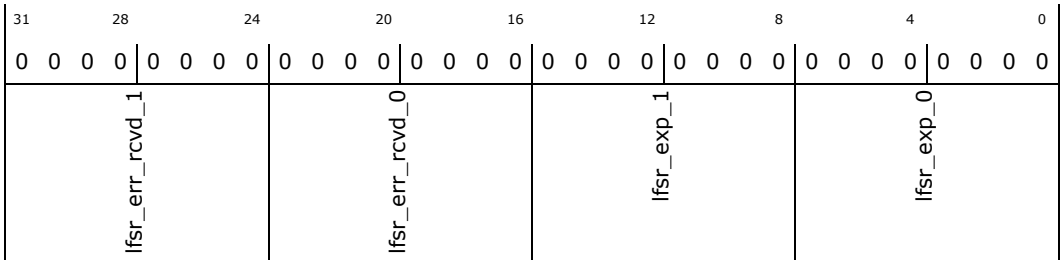
IMPREG14

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1034h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/1C	**lfsr_err_rcvd_1:** First mismatch pattern. This field remains locked until the test_pat_err_status bit is cleared
23:16	0x0 RW/1C	**lfsr_err_rcvd_0:** LSB of the above field

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW/1C	**lfsr_exp_1:** Expected pattern when the first mismatch detected. This field remains locked until the test_pat_err_status bit is cleared
7:0	0x0 RW/1C	**lfsr_exp_0:** LSB of the above field

7.8.15 reg_IMPREG15_type (IMPREG15)—Offset 1038h

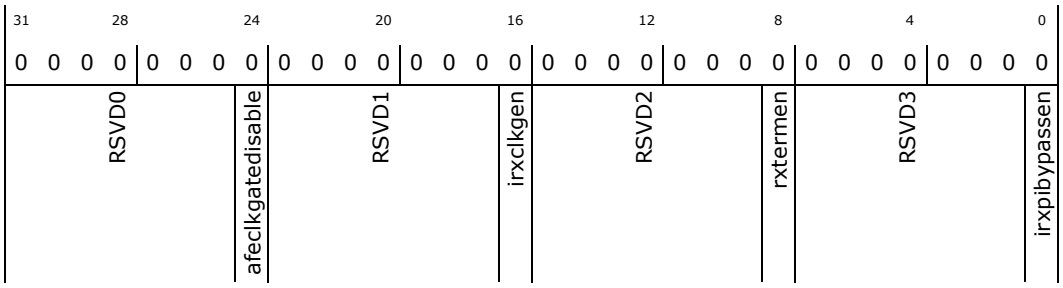
IMPREG15

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1038h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**afeclkgatedisable:** per lane divider clock input gate. 0=gated.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**irxclkgen:** enables input quad clocks to PI. Disable to save power in STALL (may need to keep them running for extra SI's to clear FIFO)
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**rxtermen:** enable RXTERM
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**irxpibypassen:** Park PI. Debug use only

7.8.16 reg_IMPREG16_type (IMPREG16)—Offset 103Ch

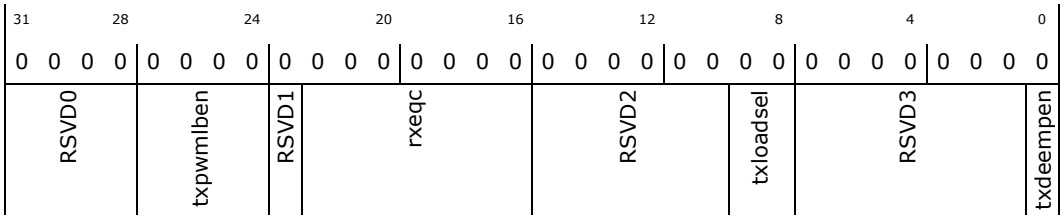
IMPREG16

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 103Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x0 RW	**txpwmlben:** Internal RX2TX loopback for PWM mode. Not supported.
23	0x0 RO	**RSVD1:** Reserved
22:16	0x0 RW	**rxeqc:** RX Equalization output to the AFE
15:10	0x0 RO	**RSVD2:** Reserved
9:8	0x0 RW	**txloadsel:** TX symbol clock CDC tuning bits. 4 possible phases to allow post silicon adjustment.
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**txdeempen:** TX de-emphasis enable

7.8.17 reg_IMPREG17_type (IMPREG17)—Offset 1040h

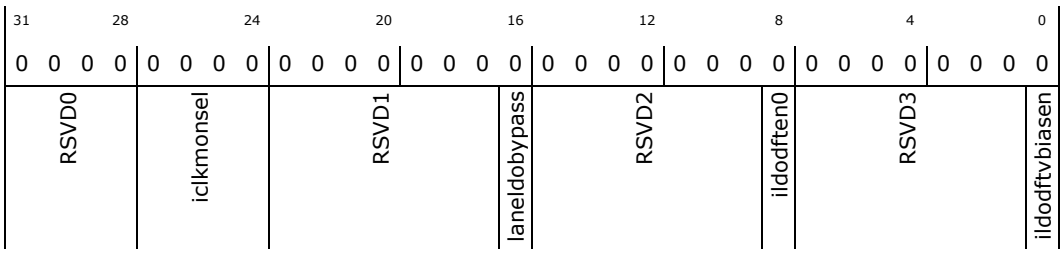
IMPREG17

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1040h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x0 RW	**iclkmonsel:** selects which clock net in lane clock block to monitor
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**laneldobypass:** per lane LDO bypass. 1 = bypass.
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**ildodften0:** LDO monitor enable.
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**ildodftvbiasen:** enable LDO bias node monitor.

7.8.18 reg_IMPREG18_type (IMPREG18)—Offset 1044h

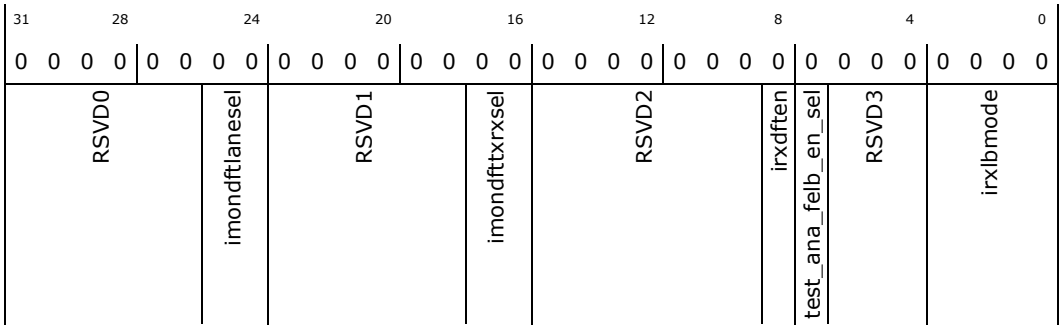
IMPREG18

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1044h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:24	0x0 RW	**imondftlanesel:** selects which digital net in lane to monitor
23:18	0x0 RO	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
17:16	0x0 RW	**imondfttxrxsel:** selects TX or RX digital nets to monitor
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**irxdften:** Enables monitor paths to internal nodes in HS RX.
7	0x0 RW	**test_ana_felb_en_sel:** Used as part of the MPHY TEST for SSIC. Setting this bit to a 1, will select the top level hc_mphy_test_ana_felb_en. Otherwise irxlbmode will be selected.
6:4	0x0 RO	**RSVD3:** Reserved
3:0	0x0 RW	**irxlbmode:** Analog FELB loopback mode. HS Serial RX data is looped back to TX.

7.8.19 reg_IMPREG19_type (IMPREG19)—Offset 1048h

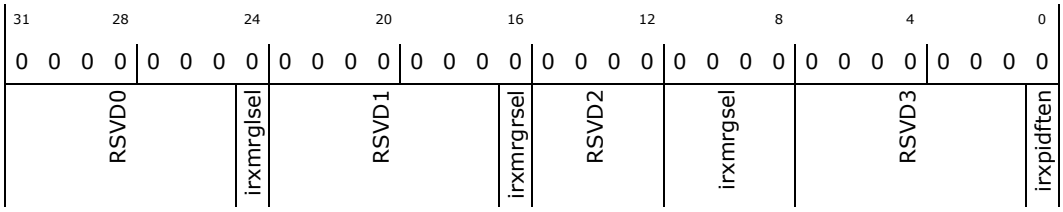
IMPREG19

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1048h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**irxmrglsel:** CDR logic margin left mode
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**irxmrgrsel:** CDR logic margin right mode
15:12	0x0 RO	**RSVD2:** Reserved
11:8	0x0 RW	**irxmrgsel:** CDR logic margin selects

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**irxpidften:** PI DFT enable. Enables PI margining.

7.8.20 reg_IMPREG20_type (IMPREG20)—Offset 104Ch

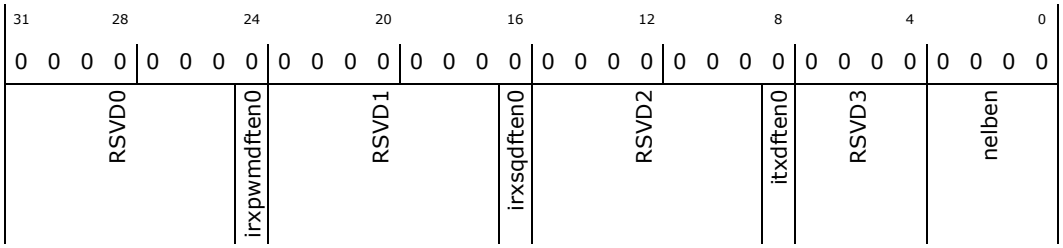
IMPREG20

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 104Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**irxpwmdften0:** RX PWM DFT mode. Enables monitoring of internal nodes in PWM RX.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**irxsqdften0:** Squelch DFT enable. Enables monitoring of internal nodes in SQ.
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**itxdften0:** TX DFT enable. Enables monitoring of internal digital nodes in TX.
7:4	0x0 RO	**RSVD3:** Reserved
3:0	0x0 RW	**nelben:** enable TX to RX NELB muxes. Not supported

7.8.21 reg_IMPREG21_type (IMPREG21)—Offset 1050h

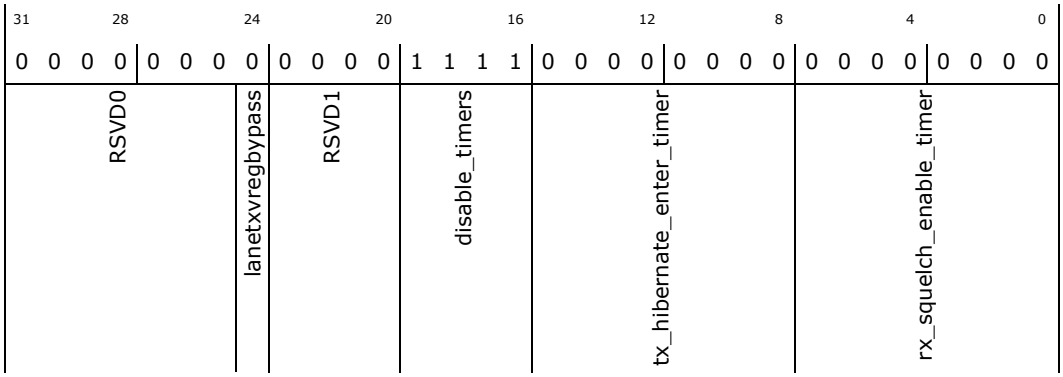
IMPREG21

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1050h

Default: 000F0000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**lanetxvregbypass:** bypass TX vreg
23:20	0x0 RO	**RSVD1:** Reserved
19:16	0xf RW	**disable_timers:** [0] - Disable tx_min_hibernate timer; [1] - Disable tx_min_sleep_time; [2] - Disable tx_min_stall_time; [3] tx_min_activate
15:8	0x0 RW	**tx_hibernate_enter_timer:** Hibernate enter timer. M-TX drives DIF-N after TOB for this timer duration before turning off TX driver. This timer is implemented in config clock.
7:0	0x0 RW	**rx_squelch_enable_timer:** RX squelch detection is enabled after this timer is expired. The timer is started when detecting TOB. It's implemented in config clock

7.8.22 reg_IMPREG22_type (IMPREG22)—Offset 1054h

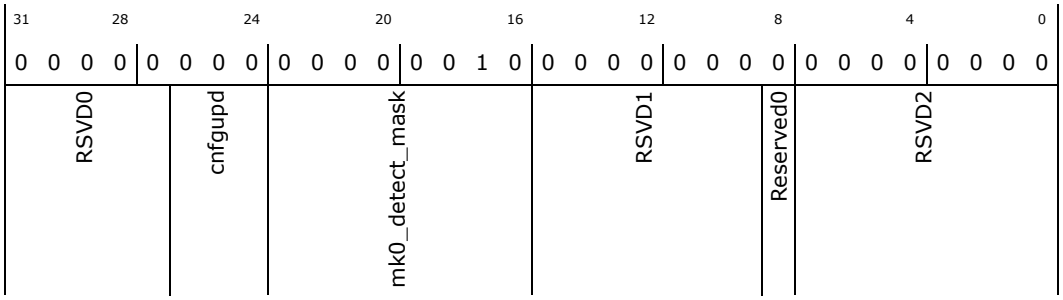
IMPREG22

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1054h

Default: 00020000h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26:24	0x0 RW	**cnfgupd:** Update effective configuration registers from shadow registers [2] - Update Private Registers: [1] - Update RX registers: [0] - Update TX Registers
23:16	0x2 RW	**mk0_detect_mask:** Delay MK0 detection after DIF-P detection to prevent false MK0 detection. Counted in pairs of symbols
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RO	**Reserved0:** Reserved.
7:0	0x0 RO	**RSVD2:** Reserved

7.8.23 reg_IMPREG23_type (IMPREG23)—Offset 1058h

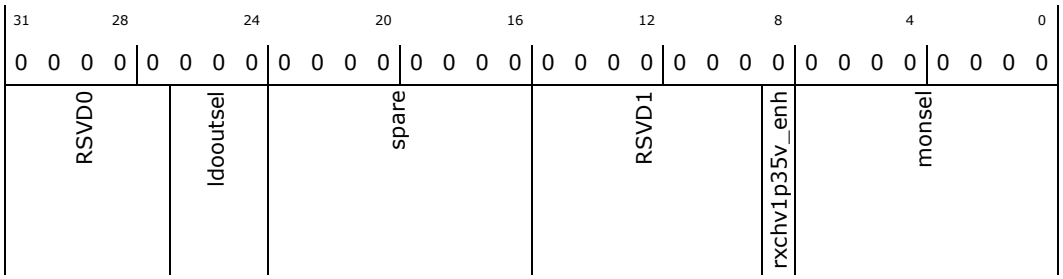
IMPREG23

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1058h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26:24	0x0 RW	**ldooutsel:** LDO output fine tune setting. Step size=10mV.
23:16	0x0 RW	**spare:** Reserved.
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**rxchv1p35v_enh:** indicates 1.35V supply is used for Squelch.
7:0	0x0 RW	**monsel:** High speed analog monitor select

7.8.24 reg_IMPREG24_type (IMPREG24)—Offset 105Ch

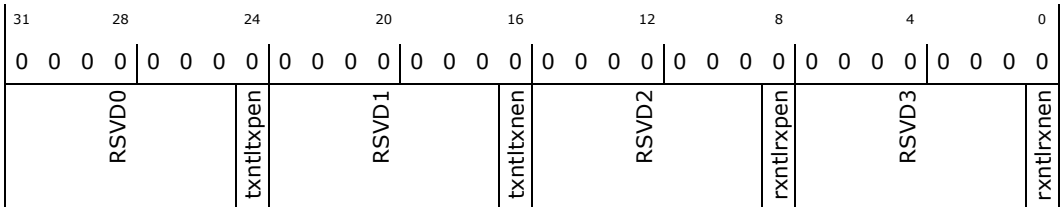
IMPREG24

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 105Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**txntltxpen:** NTL control. Not supported.
23:17	0x0 RO	**RSVD1:** Reserved
16	0x0 RW	**txntltxnen:** NTL control. Not supported.
15:9	0x0 RO	**RSVD2:** Reserved
8	0x0 RW	**rxntlrxpen:** NTL control. Not supported.

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW	**rxntlrxnen:** NTL control. Not supported.

7.8.25 reg_IMPREG25_type (IMPREG25)—Offset 1060h

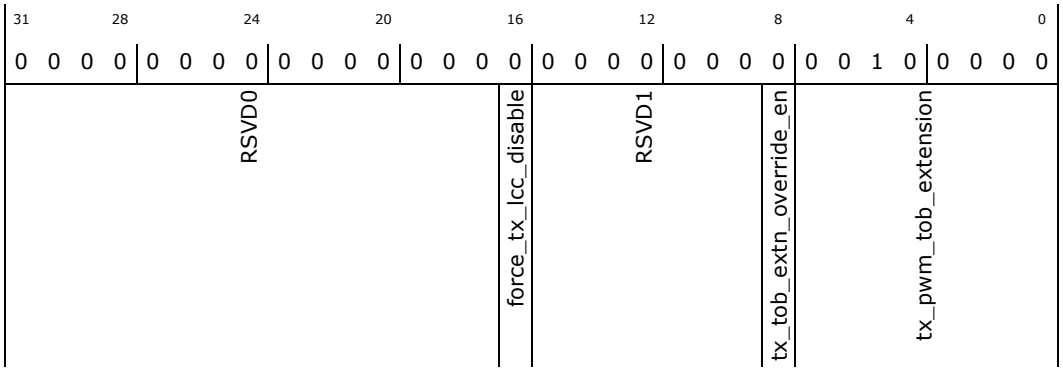
IMPREG25

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [TBD] + 1060h

Default: 00000020h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved
16	0x0 RW	**force_tx_lcc_disable:** TX LCC Disable 1: TX LCC is disabled 0: TX LCC is enabled as per the TX Register bit
15:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW	**tx_tob_extn_override_en:** If set the TX TOB Extension value will be taken from the Private space instead of the TX registers else it will be taken from TX register bank
7:0	0x20 RW	**tx_pwm_tob_extension:** TX PWM TOB Extension value

7.9 USB OTG Device PCI Configuration Registers

Table 45. Summary of PCI Configuration Registers—0/22/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 2999	22B78086h
4–7h	4	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 2999	00100000h
8–Bh	4	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 3000	0C03FE00h
C–Fh	4	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 3001	00000000h
10–13h	4	"reg_BAR_type (BAR)—Offset 10h" on page 3001	00000000h
14–17h	4	"reg_BAR1_type (BAR1)—Offset 14h" on page 3002	00000000h
2C–2Fh	4	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 3003	00000000h
30–33h	4	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 3003	00000000h
34–37h	4	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 3004	00000080h
3C–3Fh	4	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 3004	00000100h
80–83h	4	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 3005	48030001h
84–87h	4	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 3006	00000008h
F8–FBh	4	"reg_MANID_type (MANID)—Offset F8h" on page 3006	0000000Fh

7.9.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

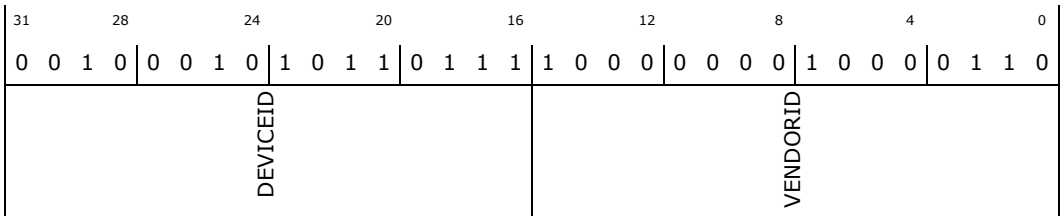
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 0h

Default: 22B78086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x22b7 RO	**DEVICEID:** Reserved.
15:0	0x8086 RO	**VENDORID:** Reserved.

7.9.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

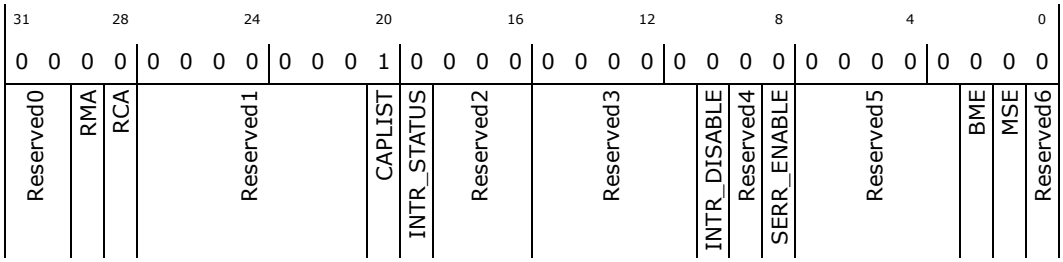
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved0:** Reserved.
29	0x0 RW/1C	**RMA:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW/1C	**RCA:** Reserved.
27:21	0x0 RO	**Reserved1:** Reserved.
20	0x1 RO	**CAPLIST:** Reserved.
19	0x0 RO	**INTR_STATUS:** Reserved.
18:16	0x0 RO	**Reserved2:** Reserved.
15:11	0x0 RO	**Reserved3:** Reserved.
10	0x0 RW	**INTR_DISABLE:** Reserved.
9	0x0 RO	**Reserved4:** Reserved.
8	0x0 RW	**SERR_ENABLE:** Reserved.
7:3	0x0 RO	**Reserved5:** Reserved.
2	0x0 RW	**BME:** Reserved.
1	0x0 RW	**MSE:** Reserved.
0	0x0 RO	**Reserved6:** Reserved.

7.9.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

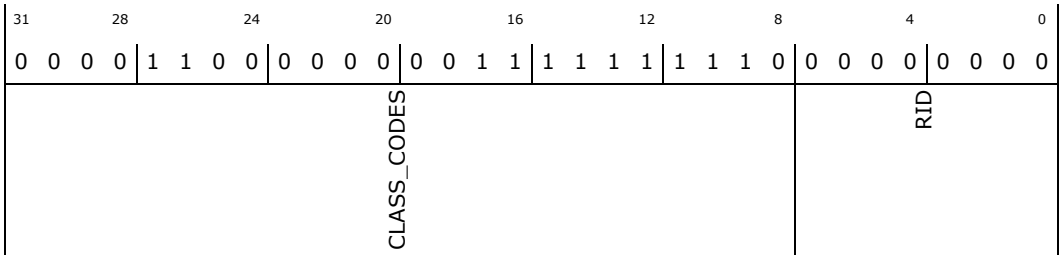
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 8h

Default: 0C03FE00h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0xc03fe RO	**CLASS_CODES:** Reserved.
7:0	0x0 RO	**RID:** Reserved.

7.9.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

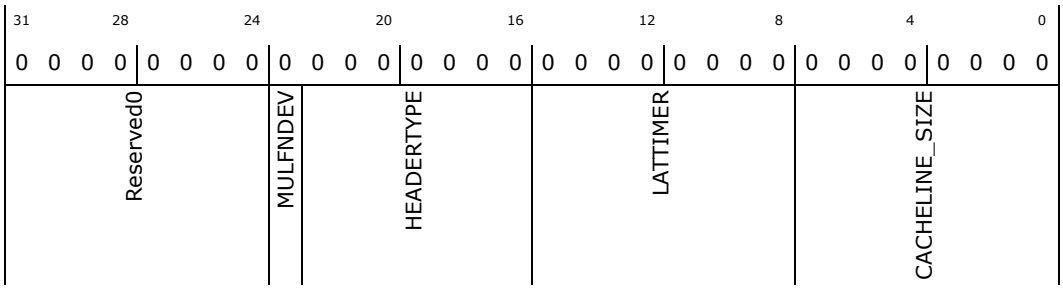
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** Reserved.
23	0x0 RO	**MULFNDEV:** Reserved.
22:16	0x0 RO	**HEADERTYPE:** Reserved.
15:8	0x0 RO	**LATTIMER:** Reserved.
7:0	0x0 RW	**CACHELINE_SIZE:** Reserved.

7.9.5 reg_BAR_type (BAR)—Offset 10h

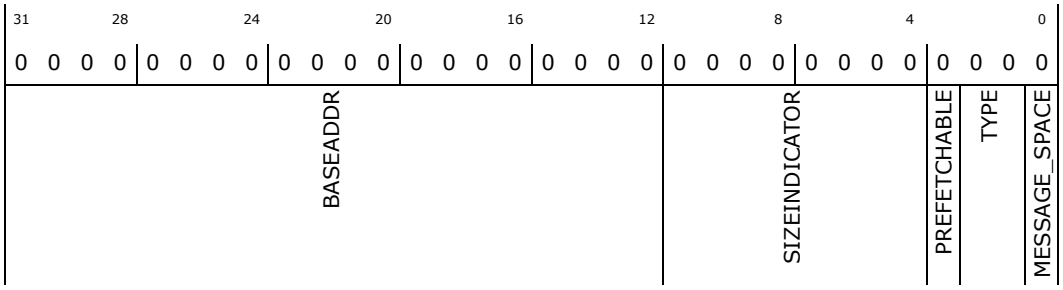
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR:** Reserved.
3	0x0 RO	**PREFETCHABLE:** Reserved.
2:1	0x0 RO	**TYPE:** Reserved.
0	0x0 RO	**MESSAGE_SPACE:** Reserved.

7.9.6 reg_BAR1_type (BAR1)—Offset 14h

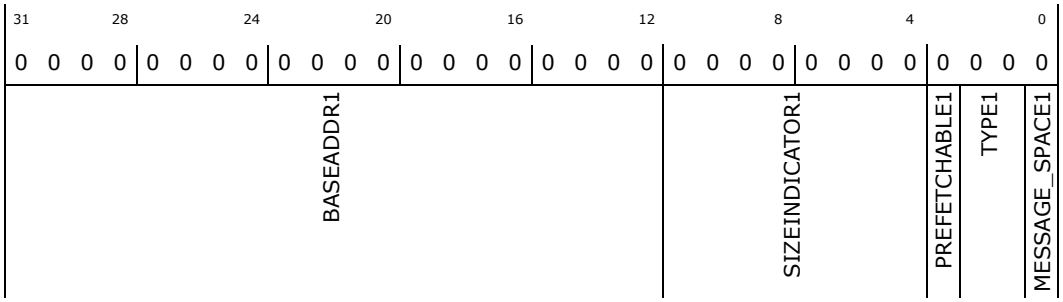
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR1:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO	**PREFETCHABLE1:** Reserved.
2:1	0x0 RO	**TYPE1:** Reserved.
0	0x0 RO	**MESSAGE_SPACE1:** Reserved.

7.9.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

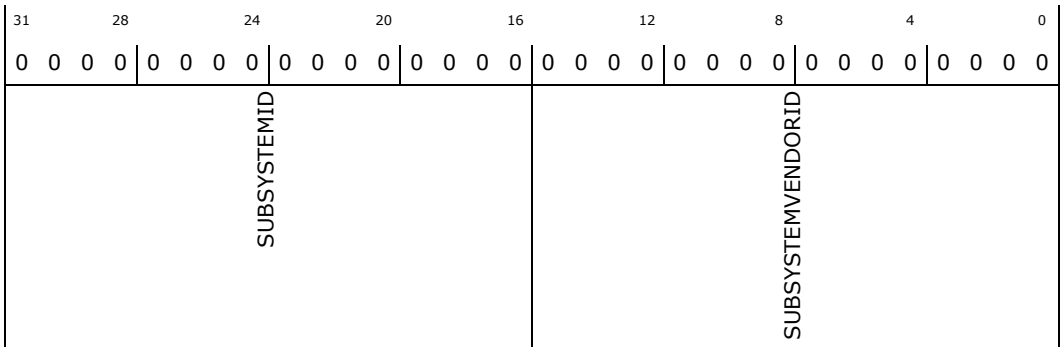
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**SUBSYSTEMID:** Reserved.
15:0	0x0 RW/O	**SUBSYSTEMVENDORID:** Reserved.

7.9.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

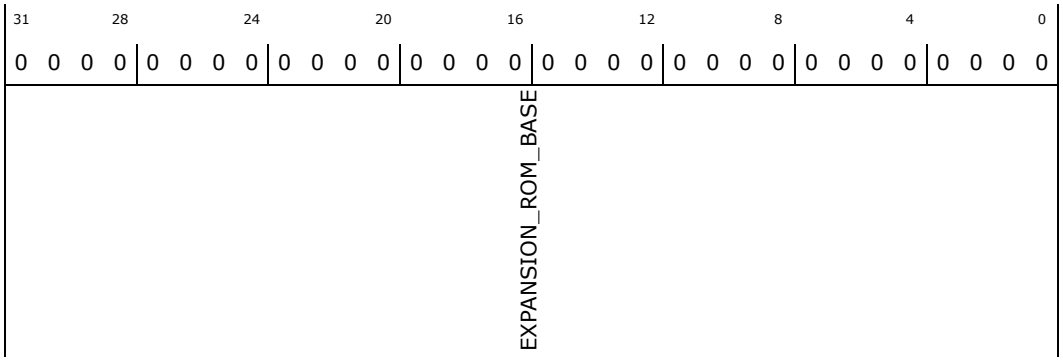
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**EXPANSION_ROM_BASE:** Reserved.

7.9.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

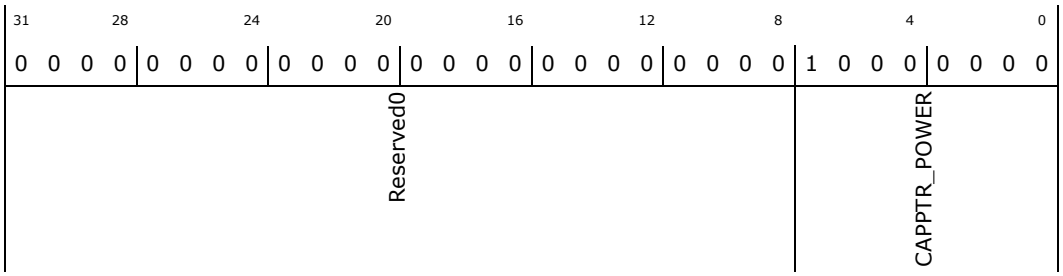
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x80 RO	**CAPPTR_POWER:** Reserved.

7.9.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

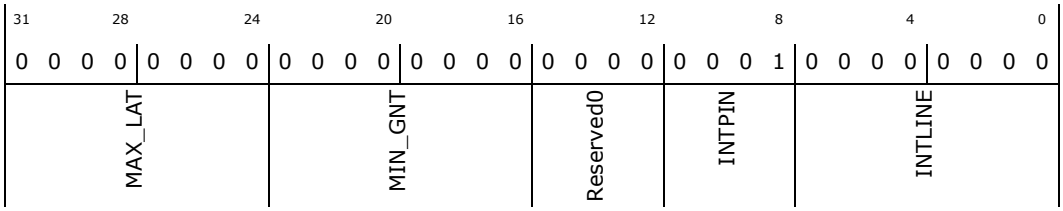
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**MAX_LAT:** Reserved.
23:16	0x0 RO	**MIN_GNT:** Reserved.
15:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RO	**INTPIN:** Reserved.
7:0	0x0 RW	**INTLINE:** Reserved.

7.9.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

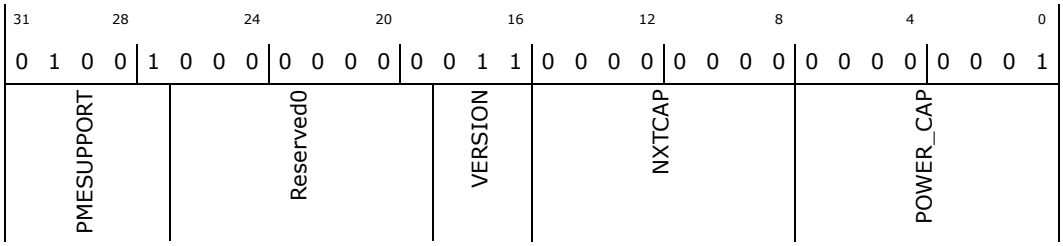
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x9 RO	**PMESUPPORT:** Reserved.
26:19	0x0 RO	**Reserved0:** Reserved.
18:16	0x3 RO	**VERSION:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**NXTCAP:** Reserved.
7:0	0x1 RO	**POWER_CAP:** Reserved.

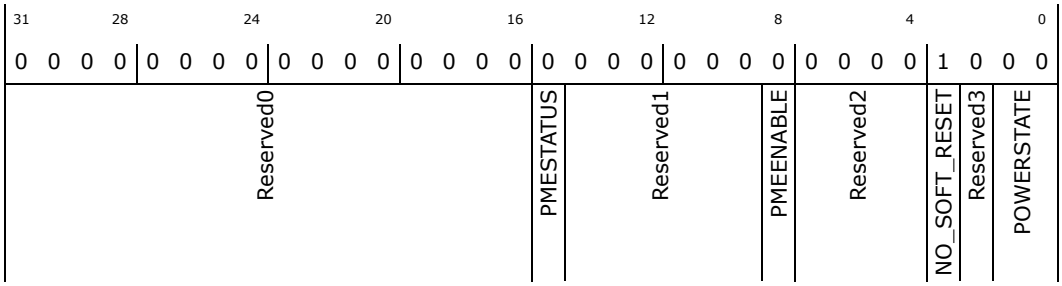
7.9.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved0:** Reserved.
15	0x0 RW/1C	**PMESTATUS:** Reserved.
14:9	0x0 RO	**Reserved1:** Reserved.
8	0x0 RW	**PMEENABLE:** Reserved.
7:4	0x0 RO	**Reserved2:** Reserved.
3	0x1 RO	**NO_SOFT_RESET:** Reserved.
2	0x0 RO	**Reserved3:** Reserved.
1:0	0x0 RW	**POWERSTATE:** Reserved.

7.9.13 reg_MANID_type (MANID)—Offset F8h

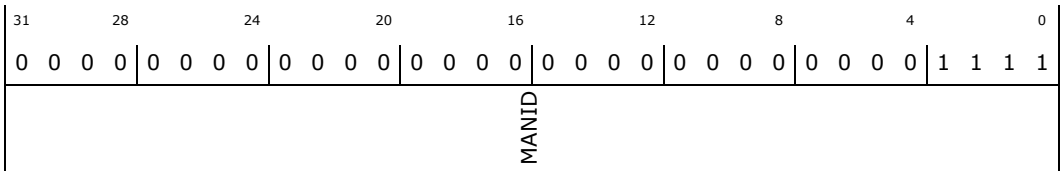
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + F8h

Default: 0000000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:0	0xf RO	**MANID:** Reserved.

7.10 USB OTG Device PCI Message Bus Registers

Table 46. Summary of Message Bus Registers—0x59

Offset	Register Name (Register Symbol)	Default Value
0–3h	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 3009	22B78086h
4–7h	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 3009	00100000h
8–Bh	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 3010	0C03FE00h
C–Fh	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 3011	00000000h
10–13h	"reg_BAR_type (BAR)—Offset 10h" on page 3012	00000000h
14–17h	"reg_BAR1_type (BAR1)—Offset 14h" on page 3012	00000000h
2C–2Fh	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 3013	00000000h
30–33h	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 3014	00000000h
34–37h	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 3014	00000080h
3C–3Fh	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 3015	00000100h
80–83h	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 3016	48030001h
84–87h	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 3016	00000008h
F8–FBh	"reg_MANID_type (MANID)—Offset F8h" on page 3017	0000000Fh

7.10.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

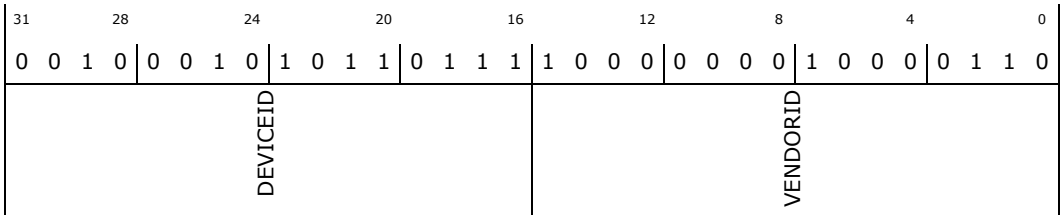
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 0h

Op Codes:

h - Read, h - Write

Default: 22B78086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x22b7 RO	**DEVICEID:** Reserved.
15:0	0x8086 RO	**VENDORID:** Reserved.

7.10.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

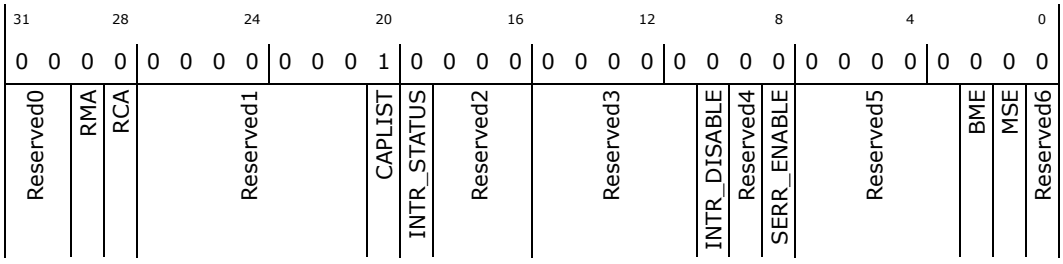
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 4h

Op Codes:

h - Read, h - Write

Default: 00100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved0:** Reserved.
29	0x0 RW/1C	**RMA:** Reserved.
28	0x0 RW/1C	**RCA:** Reserved.
27:21	0x0 RO	**Reserved1:** Reserved.
20	0x1 RO	**CAPLIST:** Reserved.
19	0x0 RO	**INTR_STATUS:** Reserved.
18:16	0x0 RO	**Reserved2:** Reserved.
15:11	0x0 RO	**Reserved3:** Reserved.
10	0x0 RW	**INTR_DISABLE:** Reserved.
9	0x0 RO	**Reserved4:** Reserved.
8	0x0 RW	**SERR_ENABLE:** Reserved.
7:3	0x0 RO	**Reserved5:** Reserved.
2	0x0 RW	**BME:** Reserved.
1	0x0 RW	**MSE:** Reserved.
0	0x0 RO	**Reserved6:** Reserved.

7.10.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

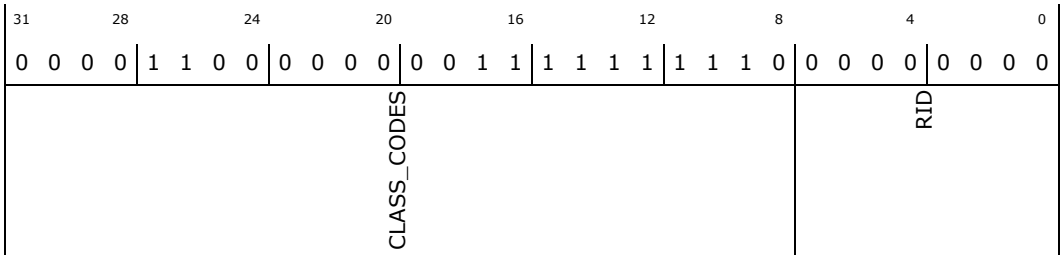
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 8h

Op Codes:

h - Read, h - Write

Default: 0C03FE00h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0xc03fe RO	**CLASS_CODES:** Reserved.
7:0	0x0 RO	**RID:** Reserved.

7.10.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

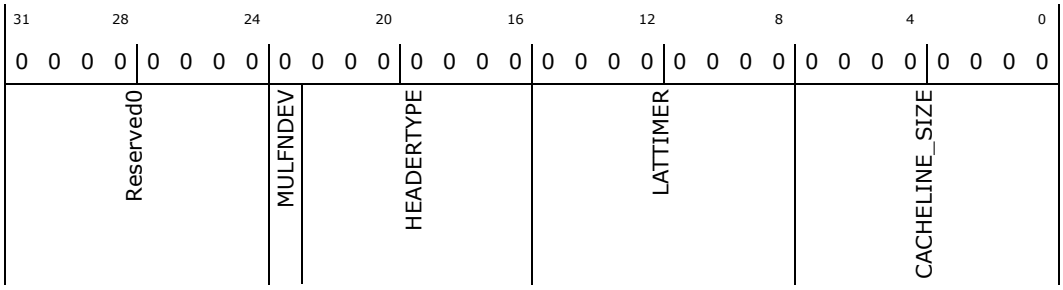
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** Reserved.
23	0x0 RO	**MULFNDEV:** Reserved.
22:16	0x0 RO	**HEADERTYPE:** Reserved.
15:8	0x0 RO	**LATTIMER:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**CACHELINE_SIZE:** Reserved.

7.10.5 reg_BAR_type (BAR)—Offset 10h

BAR -Base Address Register

Access Method

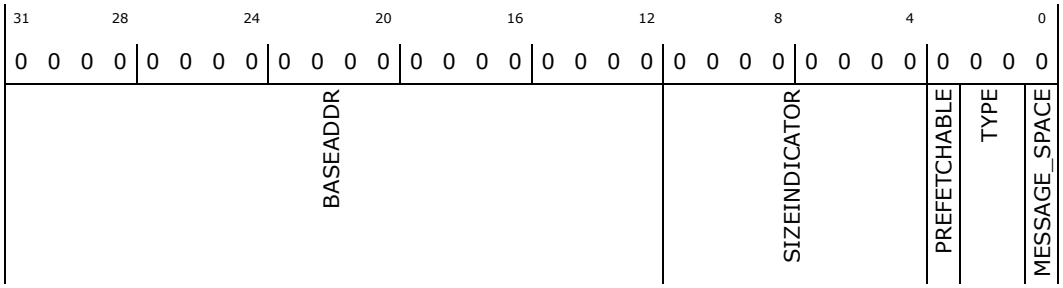
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 10h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR:** Reserved.
3	0x0 RO	**PREFETCHABLE:** Reserved.
2:1	0x0 RO	**TYPE:** Reserved.
0	0x0 RO	**MESSAGE_SPACE:** Reserved.

7.10.6 reg_BAR1_type (BAR1)—Offset 14h

BAR1 -Base Address Register1

Access Method

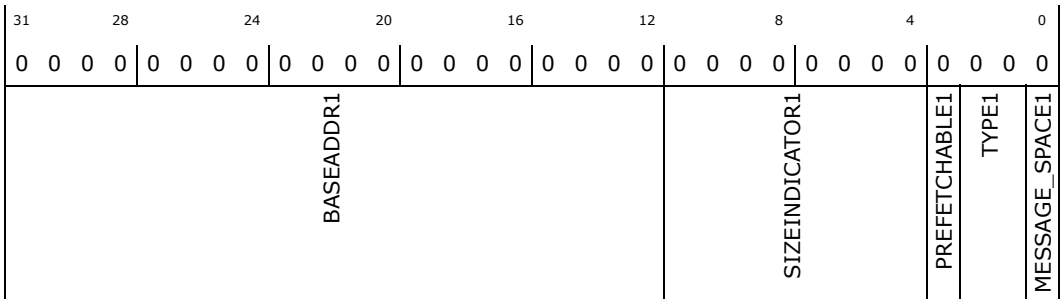
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 14h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR1:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR1:** Reserved.
3	0x0 RO	**PREFETCHABLE1:** Reserved.
2:1	0x0 RO	**TYPE1:** Reserved.
0	0x0 RO	**MESSAGE_SPACE1:** Reserved.

7.10.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

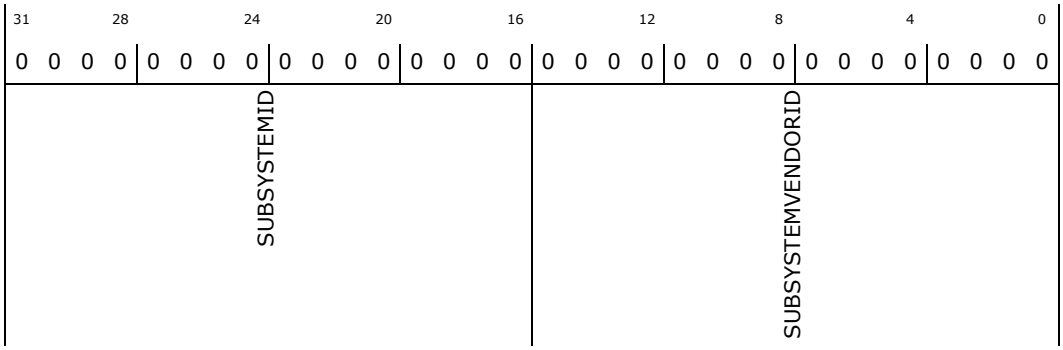
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 2Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**SUBSYSTEMID:** Reserved.
15:0	0x0 RW/O	**SUBSYSTEMVENDORID:** Reserved.

7.10.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

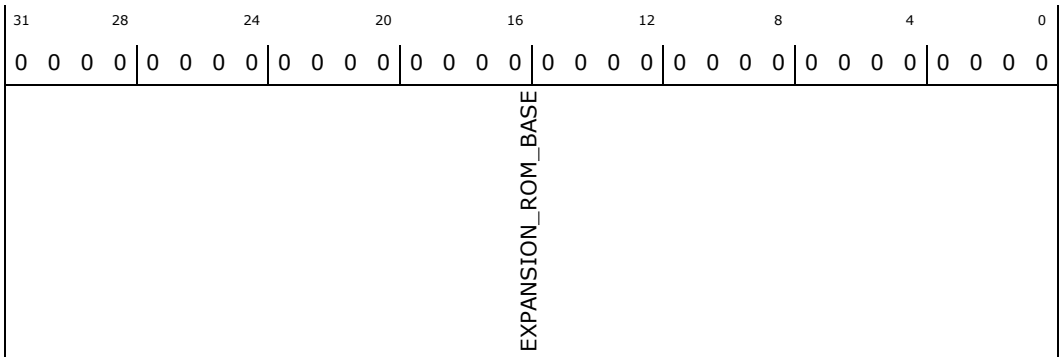
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 30h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**EXPANSION_ROM_BASE:** Reserved.

7.10.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

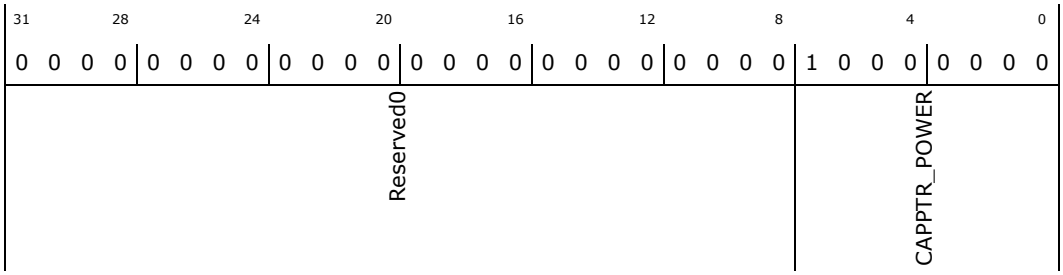
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 34h

Op Codes:

h - Read, h - Write

Default: 00000080h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x80 RO	**CAPPTR_POWER:** Reserved.

7.10.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

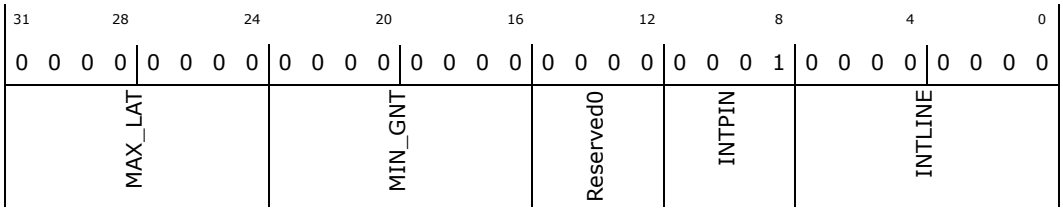
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 3Ch

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**MAX_LAT:** Reserved.
23:16	0x0 RO	**MIN_GNT:** Reserved.
15:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RO	**INTPIN:** Reserved.
7:0	0x0 RW	**INTLINE:** Reserved.

7.10.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

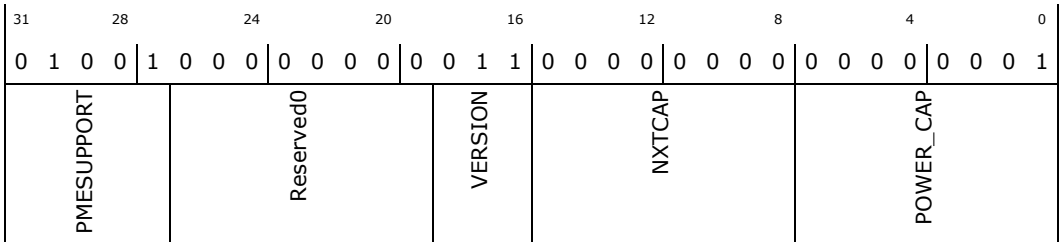
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 80h

Op Codes:

h - Read, h - Write

Default: 48030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x9 RO	**PMESUPPORT:** Reserved.
26:19	0x0 RO	**Reserved0:** Reserved.
18:16	0x3 RO	**VERSION:** Reserved.
15:8	0x0 RO	**NXTCAP:** Reserved.
7:0	0x1 RO	**POWER_CAP:** Reserved.

7.10.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

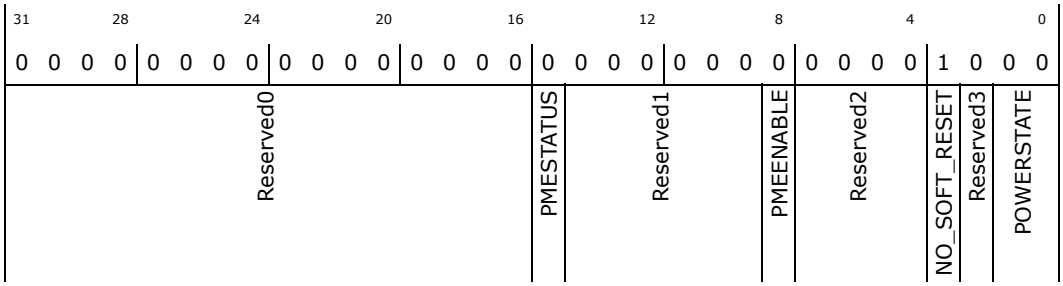
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 84h

Op Codes:

h - Read, h - Write

Default: 00000008h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved0:** Reserved.
15	0x0 RW/1C	**PMESTATUS:** Reserved.
14:9	0x0 RO	**Reserved1:** Reserved.
8	0x0 RW	**PMEENABLE:** Reserved.
7:4	0x0 RO	**Reserved2:** Reserved.
3	0x1 RO	**NO_SOFT_RESET:** Reserved.
2	0x0 RO	**Reserved3:** Reserved.
1:0	0x0 RW	**POWERSTATE:** Reserved.

7.10.13 reg_MANID_type (MANID)—Offset F8h

Manufacturers ID

Access Method

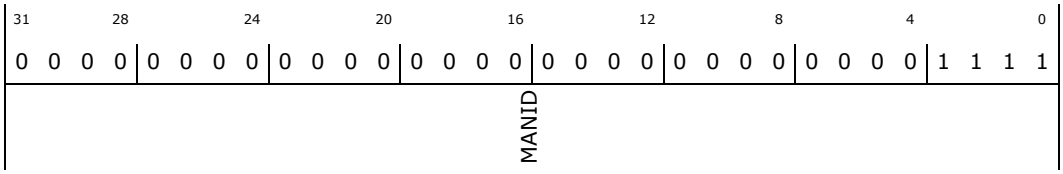
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + F8h

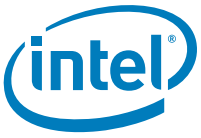
Op Codes:

h - Read, h - Write

Default: 0000000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:0	0xf RO	**MANID:** Reserved.



7.11 USB OTG Device Private Message Bus Registers

Table 47. Summary of Message Bus Registers—0x59

Offset	Register Name (Register Symbol)	Default Value
0–3h	"reg_IOSFCTL_type (IOSFCTL)—Offset 0h" on page 3024	0000000Fh
8–Bh	"reg_IOSFSTS_type (IOSFSTS)—Offset 8h" on page 3024	00000000h
10–13h	"reg_OCPCTL_type (OCPCTL)—Offset 10h" on page 3025	000000F1h
20–23h	"reg_FLSH_type (FLSH)—Offset 20h" on page 3026	00000000h
30–33h	"reg_RID_type (RID)—Offset 30h" on page 3027	00000000h
34–37h	"reg_CAPID_type (CAPID)—Offset 34h" on page 3027	00000000h
50–53h	"reg_SPARE_type (SPARE)—Offset 50h" on page 3028	00000000h
60–63h	"reg_IOSFSBA_type (IOSFSBA)—Offset 60h" on page 3028	00000000h

7.11.1 reg_IOSFCTL_type (IOSFCTL)—Offset 0h

This register controls some of the behaviors of IOSF interface.

Access Method

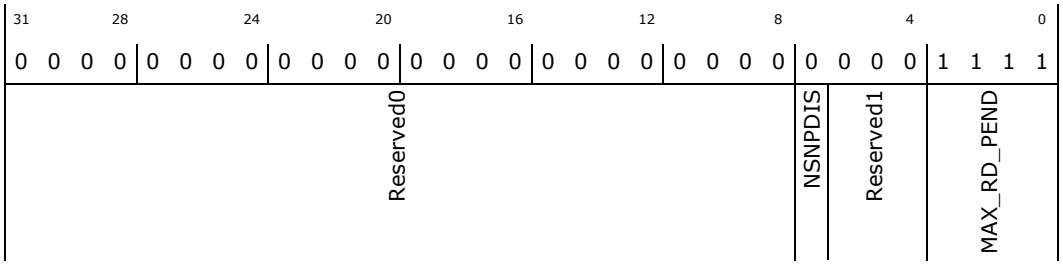
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 0h

Op Codes:

h - Read, h - Write

Default: 0000000Fh



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7	0x0 RW	**NSNPDIS:** Non-snoop Disable. When set, all requests from Bridge on IOSF Primary are snooped. When reset, Bridge obeys MReqInfo attribute on OCP faric to generate snoop or non-snoop transactions.
6:4	0x0 RO	**Reserved1:** Reserved.
3:0	0xf RW	**MAX_RD_PEND:** Maximum number of upstream outstanding reads from Bridge towards IOSF Primary Channel. In reality, number of outstanding read requests towards IOSF could be less than this number depending on resource availability inside IOSF fabric. S/W Programming Model restriction: S/W must ensure there is no upstream DMA traffic is going on when this field is being programmed. Note: This only exists for Channel0. This represents only the upper 4b of the vector. Lowest 2 bits are assumed to be 1's. So max number of reads are x*4+3 where x is the value programmed in this field.

7.11.2 reg_IOSFSTS_type (IOSFSTS)—Offset 8h

This register provides status of some of the events inside OCP Bridge.

Access Method

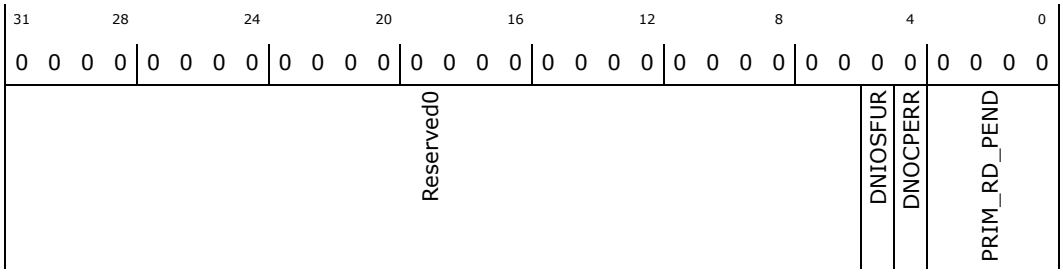
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 8h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved0:** Reserved.
5	0x0 RW/1C	**DNIOSFUR:** Error response received from IOSF for Bridges requests.
4	0x0 RW/1C	**DNOCPERR:** ERR response received from OCP and forwarded to IOSF Primary or Sideband Channels. S/W writes a 1 to clear this
3:0	0x0 RO	**PRIM_RD_PEND:** Number of upstream outstanding reads inside Bridge on IOSF Channel 0. This field does not exist for other IOSF Channels. This field only shows upper 4b of the 6b vector.

7.11.3 reg_OCPCTL_type (OCPCTL)—Offset 10h

This register controls some of the behaviors of OCP interface.

Access Method

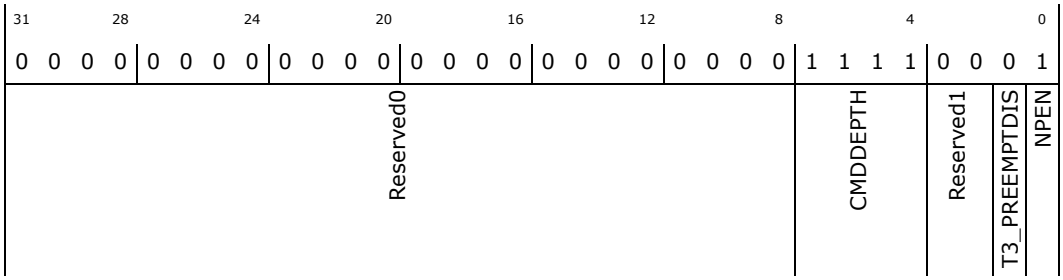
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 10h

Op Codes:

h - Read, h - Write

Default: 000000F1h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0xf RW	**CMDDEPTH:** Effective depth of upstream unified command buffer. Any value more than actual physical depth has no impact on behavior. If this field is programmed with a lesser value, say x, unpstream buffer could have commands upto a max of x + 2. This can be used for debug of performance issues if latency becomes an issue.
3:2	0x0 RO	**Reserved1:** Reserved.
1	0x0 RW	**T3_PREEMPTDIS:** Requests and data transfers on Thread3 are always fixed high priority over requests and data transfers on Thread0. So a Thread3 request can preempt data transfer on Thread0. When this bit is set, Thread3 requests cannot preempt Thread0 data transfers.
0	0x1 RW	**NPEN:** Enable downstream non-posted memory write capability. When clear, Bridge does not generate downstream non-posted memory write requests. When set, all downstream memory write requests are non-posted with exception of those that fall into ranges defined by PWBASE and PWLIMIT registers. S/W could change this bit on the fly while downstream traffic is in progress.

7.11.4 reg_FLSH_type (FLSH)—Offset 20h

This register can be used by OCP agents on Thread 0 to flush any of its writes to global observation point.

Access Method

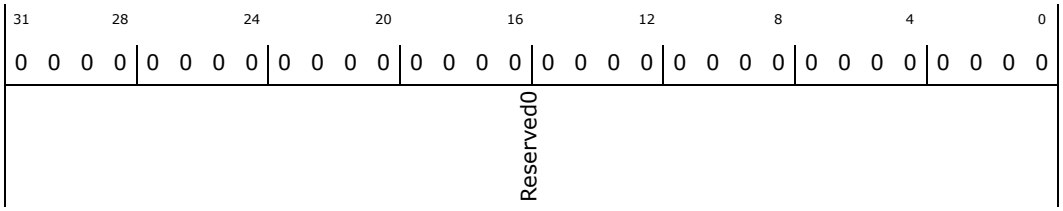
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 20h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved0:** Reserved. This register exists so that agents on OCP fabric can read or write to this register to flush any outstanding transactions in the OCP fabric to Bridge. Read or write to this register does not have any side-effect inside the Bridge and request is terminated gracefully. This register definition also enables firmware or device driver of other IPs to have a permanent hook that it can use to cause a flush. Since all transactions are strictly ordered, any read or write transaction to this register pushes all previous transactions from that agent to the Bridge.

7.11.5 reg_RID_type (RID)—Offset 30h

This register contains Revision ID of Bridge.

Access Method

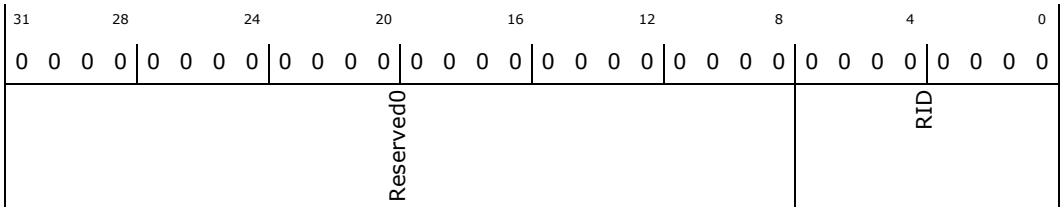
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 30h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x0 RO	**RID:** Revision ID of the Bridge.

7.11.6 reg_CAPID_type (CAPID)—Offset 34h

This register describes capabilities of Bridge.

Access Method

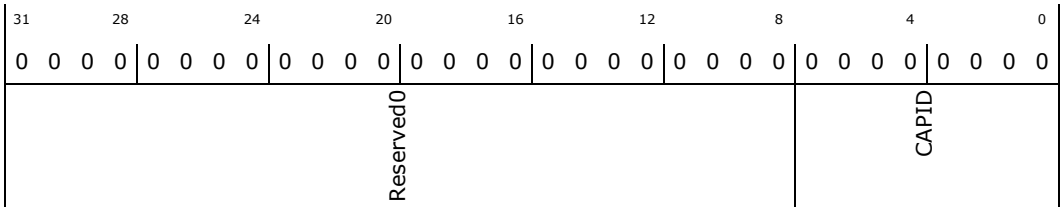
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 34h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x0 RO	**CAPID:** For future use.

7.11.7 reg_SPARE_type (SPARE)—Offset 50h

This is a space register.

Access Method

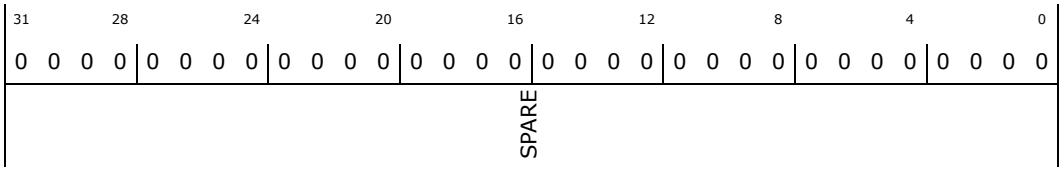
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 50h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SPARE:** This register defines spare configuration bits and reserved for future use

7.11.8 reg_IOSFSBA_type (IOSFSBA)—Offset 60h

There is no physical hardware structure for this register. This is used by SCU to initiated a message on IOSF Sideband Channel. This is same as cDMI_MSG_LNG register with same offset in Langwell for backwards compatibility of SCU firmware. This is a Write-Only location and is accessible only to SCU. A read request to this location by SCU will result in undefined Bridge behavior. This is a 64b register.

Access Method

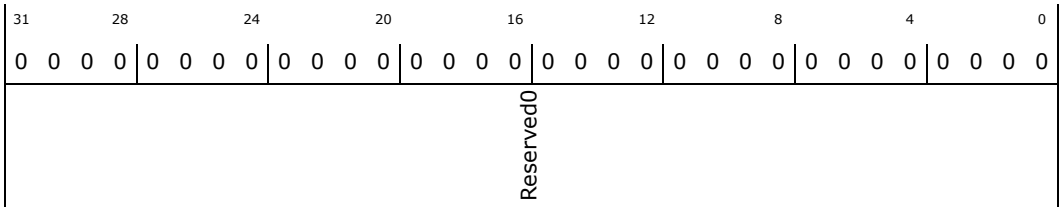
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 60h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved0:** Reserved.

7.11.9 reg_UPARBGNTCNTVC0_type (UPARBGNTCNTVC0)—Offset 68h

This contains Upstream Arbitration Grant counter value for VC0.

Access Method

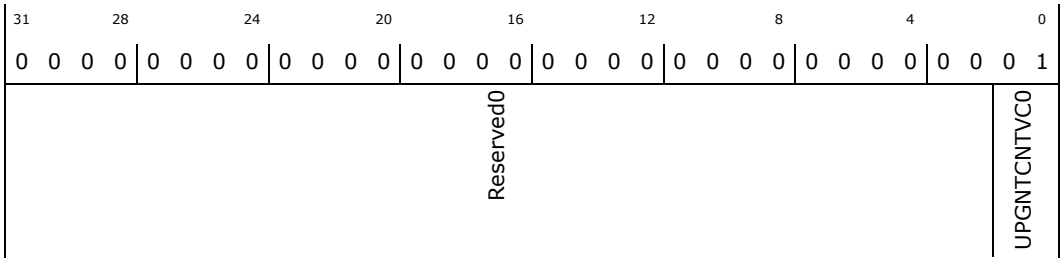
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 68h

Op Codes:

h - Read, h - Write

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x1 RW	**UPGNTCNTVC0:** This determines how many upstream VC0 requests can be launched before a new arbitration session starts. Value of '0' implies no bound, '1' implies 2 requests, '2' implies 4 requests and '3' implies 8 requests.

7.11.10 reg_UPARBGNTCNTVC1_type (UPARBGNTCNTVC1)—Offset 6Ch

This contains Upstream Arbitration Grant counter value for VC1.

Access Method

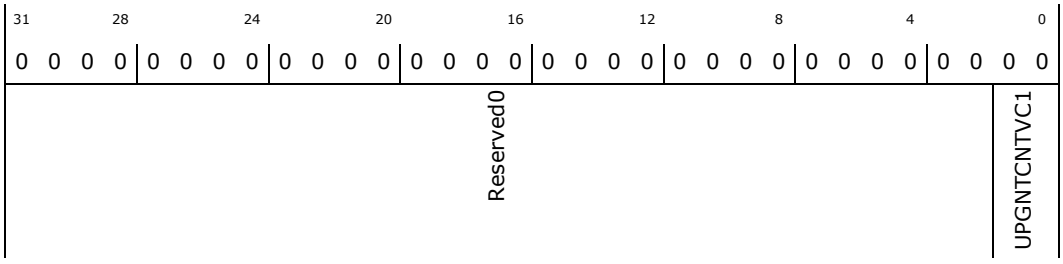
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 6Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x0 RW	**UPGNTCNTVC1:** This determines how many upstream VC1 requests can be launched before it is masked to prevent starvation of lower priority requests. Value of '0' implies no bound, '1' implies 2 requests, '2' implies 4 requests and '3' implies 8 requests.

7.11.11 reg_UPARBGNTCNTVC2_type (UPARBGNTCNTVC2)—Offset 70h

This contains Upstream Arbitration Grant counter value for VC2.

Access Method

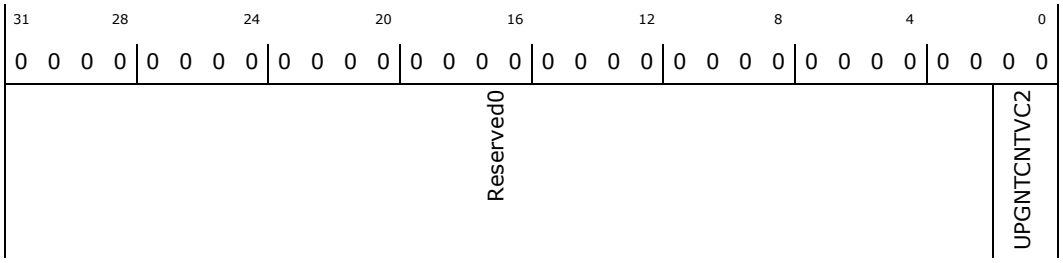
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 70h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x0 RW	**UPGNTCNTVC2:** This determines how many upstream VC2 requests can be launched before it is masked to prevent starvation of lower priority requests. Value of '0' implies no bound, '1' implies 2 requests, '2' implies 4 requests and '3' implies 8 requests.

7.11.12 reg_DNARBGNTCNT_T0_type (DNARBGNTCNT_T0)—Offset 74h

This contains Downstream Arbitration Grant counter value for Thread0.

Access Method

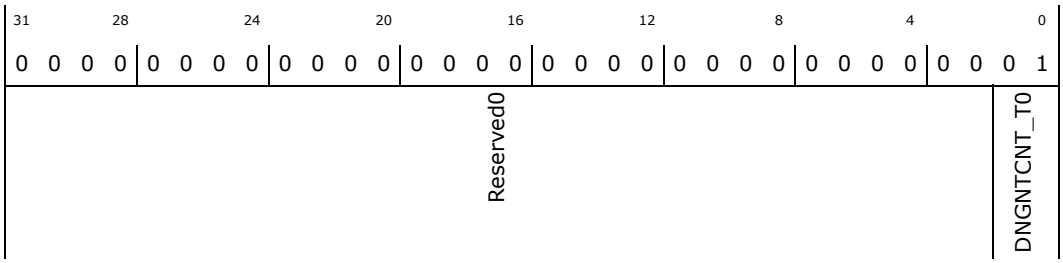
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 74h

Op Codes:

h - Read, h - Write

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x1 RW	**DNGNTCNT_T0:** This determines how many downstream Thread0 data phases can be launched before a new arbitration session starts. Value of '0' implies no bound, '1' implies 8 data phases, '2' implies 16 data phases and '3' implies 24 data phases.

7.11.13 reg_DNARBGNTCNT_T1_type (DNARBGNTCNT_T1)—Offset 78h

This contains Downstream Arbitration Grant counter value for Thread1.

Access Method

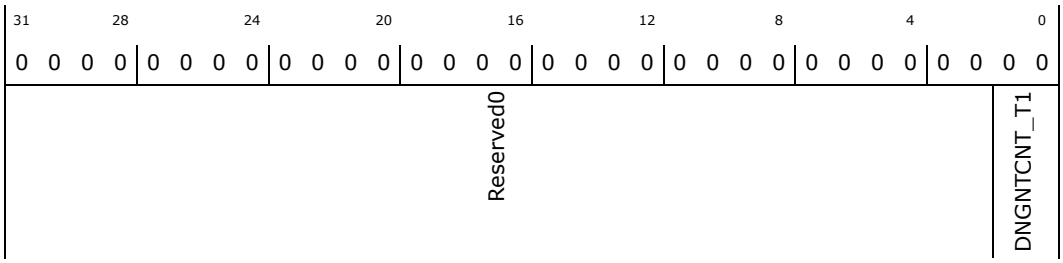
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 78h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x0 RW	**DNGNTCNT_T1:** This determines how many downstream Thread1 data phases can be launched before it is masked to prevent starvation of lower priority responses. Value of '0' implies no bound, '1' implies 8 data phases, '2' implies 16 data phases and '3' implies 24 data phases.

7.11.14 reg_DNARBGNTCNT_T2_type (DNARBGNTCNT_T2)—Offset 7Ch

This contains Downstream Arbitration Grant counter value for Thread2.

Access Method

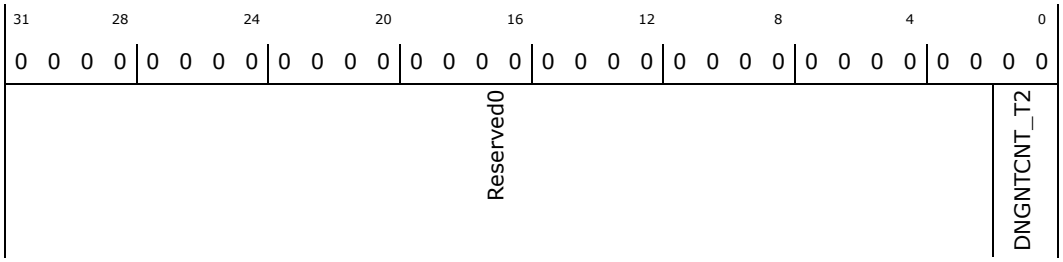
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 7Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x0 RW	**DNGNTCNT_T2:** This determines how many downstream Thread2 data phases can be launched before it is masked to prevent starvation of lower priority responses. Value of '0' implies no bound, '1' implies 8 data phases, '2' implies 16 data phases and '3' implies 24 data phases.

7.11.15 reg_APICBASE_type (APICBASE)—Offset C0h

This register controls IOAPIC related functionality inside Bridge.

Access Method

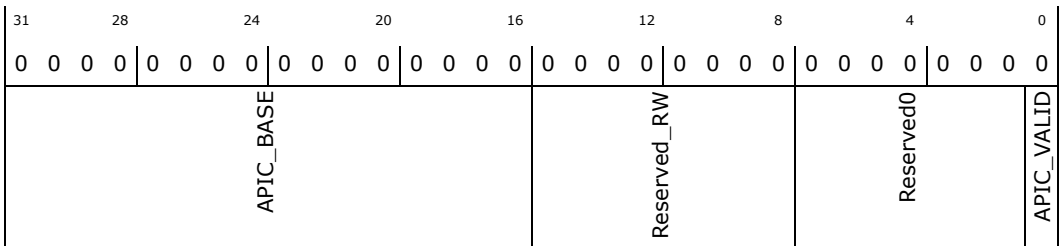
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + C0h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**APIC_BASE:** Programmable Base Address for IOAPIC registers
15:8	0x0 RW	**Reserved_RW:** Must be always 0's
7:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RW	**APIC_VALID:** When set, it indicates IOAPIC support is enabled and address in APIC_BASE is valid.

7.11.16 reg_SRAMBASE_type (SRAMBASE)—Offset C4h

This register controls SRAM related functionality inside Bridge.

Access Method

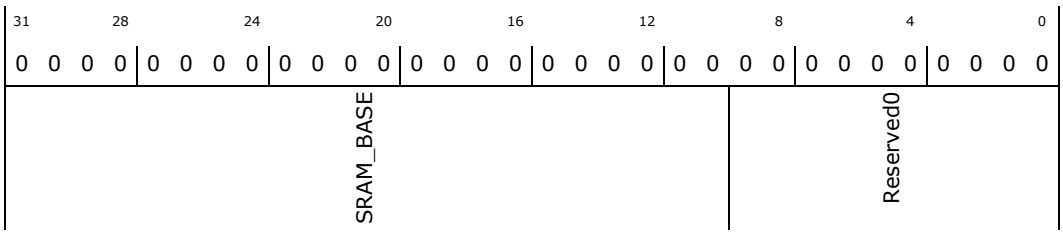
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + C4h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**SRAM_BASE:** Programmable Base Address for IOAPIC registers in Shared SRAM
9:0	0x0 RO	**Reserved0:** Reserved.

7.11.17 reg_IOREGSELBASE_type (IOREGSELBASE)—Offset C8h

This register controls IOREGSEL related functionality inside Bridge.

Access Method

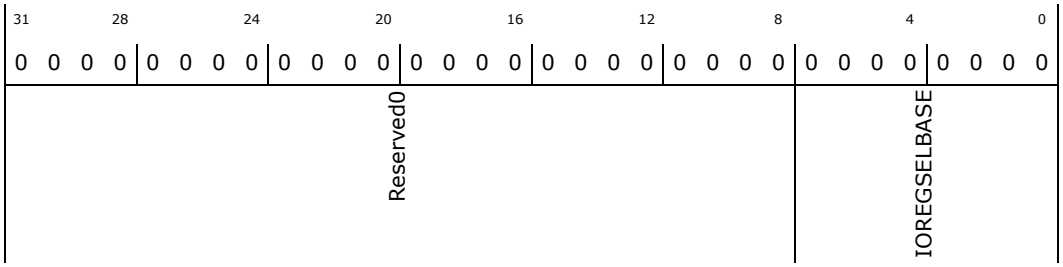
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + C8h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x0 RW	**IOREGSELBASE:** When a write to IOWIN register occurs, Bridge generates an Interrupt if associated IOREGSEL falls within IOREGSELBASE and IOREGSELLIMIT range and IOWIN_INT_EN is 1.

7.11.18 reg_IOREGSELLIMIT_type (IOREGSELLIMIT)—Offset CCh

This register controls IOREGSEL/IOWIN related functionality inside Bridge.

Access Method

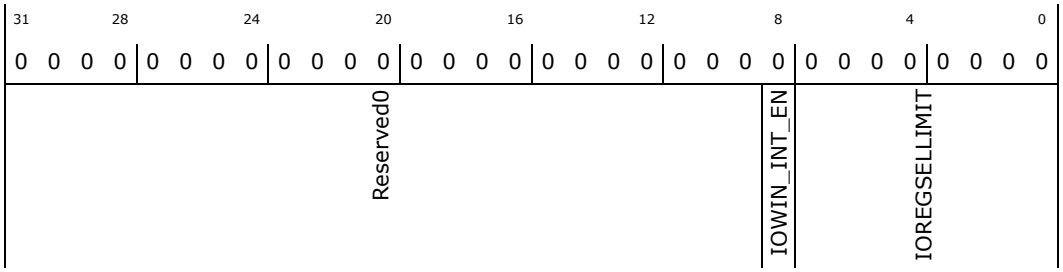
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + CCh

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved0:** Reserved.
8	0x0 RW	**IOWIN_INT_EN:** When set, enables generation of Interrupt message to SCU when a write access to APIC IOWIN is made from IOSF Primary Channel and IOREGSEL value falls within IOREGSELBASE and IOREGSELLIMIT values.
7:0	0x0 RW	**IOREGSELLIMIT:** When a write to IOWIN register occurs, Bridge generates an Interrupt if associated IOREGSEL falls within IOREGSELBASE and IOREGSELLIMIT range and IOWIN_INT_EN is 1.

7.11.19 reg_PWBASE0_type (PWBASE0)—Offset 100h

This register contains an address range for downstream posted memory writes.

Access Method

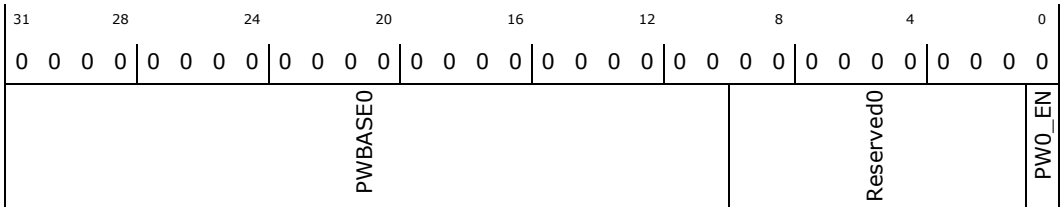
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 100h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWBASE0:** Programmable Base Address of 1K memory region to which all downstream memory writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 0s. A downstream posted memory write from IOSF will be launched as a downstream posted memory write on OCP fabric if its address is within PWBASE/PWLIMIT range of any of the 4 pairs of registers. Otherwise, the downstream posted memory write is launched as a non-posted memory write on OCP fabric. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:**
0	0x0 RW	**PW0_EN:** When set, Address region defined by PWBASE0/1/2/3 and PWLIMIT0/1/2/3 is valid. In normal functional mode, all downstream writes are expected to be non-posted and hence, PWBASE and PWLIMIT registers are not used. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress.

7.11.20 reg_PWLIMIT0_type (PWLIMIT0)—Offset 104h

This register contains an address range for downstream posted memory writes.

Access Method

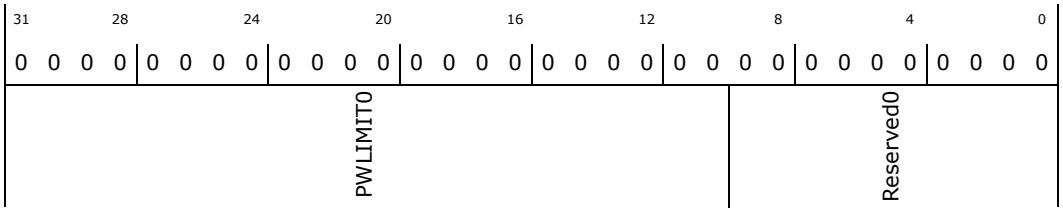
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 104h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWLIMIT0:** Programmable Upper Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 1s. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set
9:0	0x0 RO	**Reserved0:**

7.11.21 reg_PWBASE1_type (PWBASE1)—Offset 108h

This register contains an address range for downstream posted memory writes.

Access Method

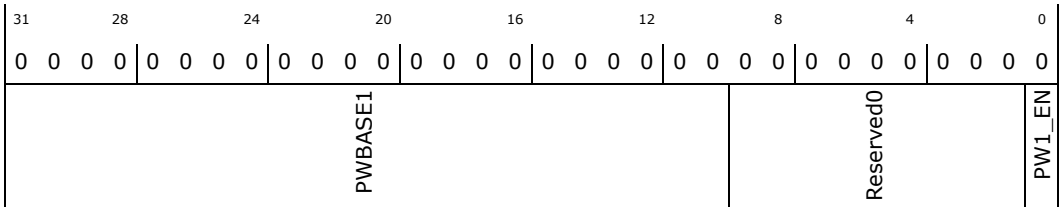
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 108h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWBASE1:** Programmable Base Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 0s. A downstream posted memory write from IOSF will be launched as a downstream posted memory write on OCP fabric if its address is within PWBASE/PWLIMIT range of any of the 4 pairs of registers. Otherwise, the downstream posted memory write is launched as a non-posted memory write on OCP fabric. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set
9:1	0x0 RO	**Reserved0:**

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**PW1_EN:** When set, Address region defined by PWBASE0/1/2/3 and PWLIMIT0/1/2/3 is valid. In normal functional mode, all downstream writes are expected to be non-posted and hence, PWBASE and PWLIMIT registers are not used. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress.

7.11.22 reg_PWLIMIT1_type (PWLIMIT1)—Offset 10Ch

This register contains an address range for downstream posted memory writes.

Access Method

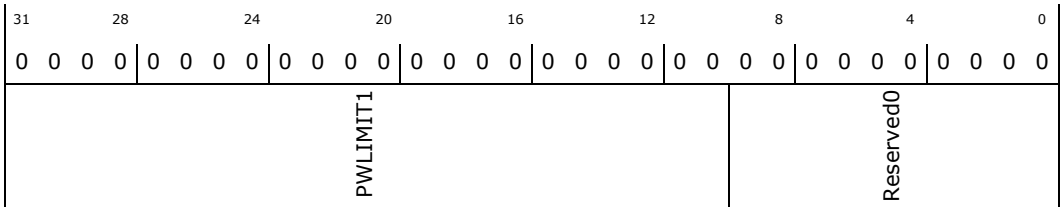
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 10Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWLIMIT1:** Programmable Upper Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 1s. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:0	0x0 RO	**Reserved0:** Reserved.

7.11.23 reg_PWBASE2_type (PWBASE2)—Offset 110h

This register contains an address range for downstream posted memory writes.

Access Method

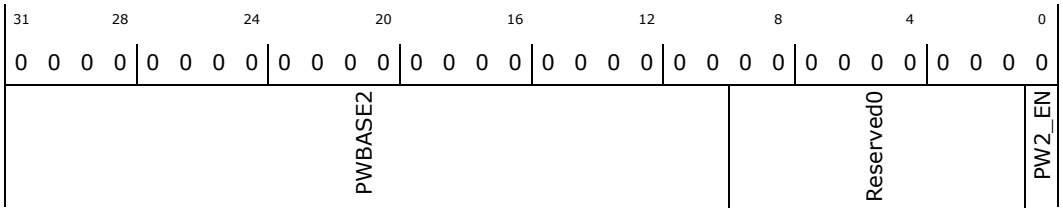
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 110h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWBASE2:** Programmable Base Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 0s. A downstream posted memory write from IOSF will be launched as a downstream posted memory write on OCP fabric if its address is within PWBASE/PWLIMIT range of any of the 4 pairs of registers. Otherwise, the downstream posted memory write is launched as a non-posted memory write on OCP fabric. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:**
0	0x0 RW	**PW2_EN:** When set, Address region defined by PWBASE0/1/2/3 and PWLIMIT0/1/2/3 is valid. In normal functional mode, all downstream writes are expected to be non-posted and hence, PWBASE and PWLIMIT registers are not used. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress.

7.11.24 reg_PWLIMIT2_type (PWLIMIT2)—Offset 114h

This register contains an address range for downstream posted memory writes.

Access Method

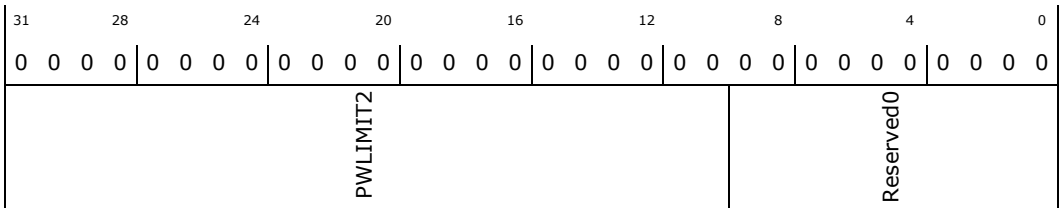
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 114h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWLIMIT2:** Programmable Upper Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 1s. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:0	0x0 RO	**Reserved0:**

7.11.25 reg_PWBASE3_type (PWBASE3)—Offset 118h

This register contains an address range for downstream posted memory writes.

Access Method

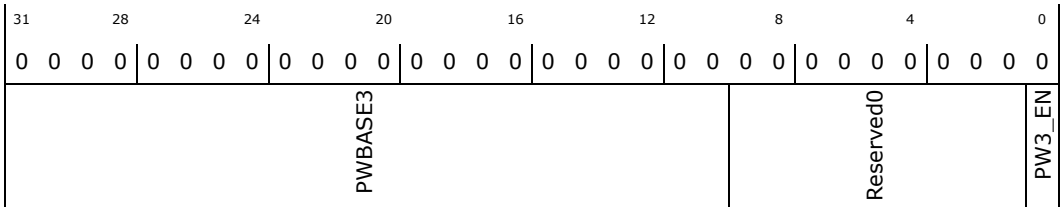
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 118h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWBASE3:** Programmable Base Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 0s. A downstream posted memory write from IOSF will be launched as a downstream posted memory write on OCP fabric if its address is within PWBASE/PWLIMIT range of any of the 4 pairs of registers. Otherwise, the downstream posted memory write is launched as a non-posted memory write on OCP fabric. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:**
0	0x0 RW	**PW3_EN:** When set, Address region defined by PWBASE0/1/2/3 and PWLIMIT0/1/2/3 is valid. In normal functional mode, all downstream writes are expected to be non-posted and hence, PWBASE and PWLIMIT registers are not used. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress.

7.11.26 reg_PWLIMIT3_type (PWLIMIT3)—Offset 11Ch

This register contains an address range for downstream posted memory writes.

Access Method

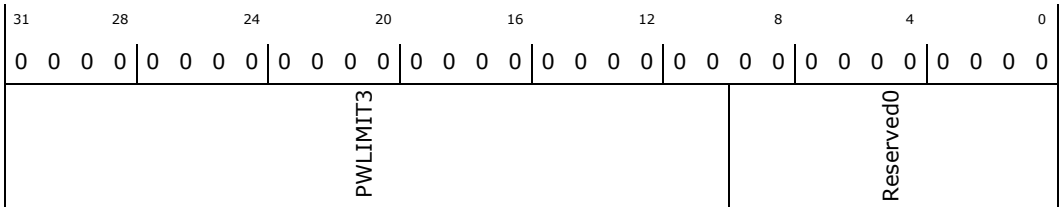
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 11Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**PWLIMIT3:** Programmable Upper Address of 1K memory region to which all downstream writes initiated by Bridge towards OCP fabric are launched as posted memory writes. For address comparison purposes, remaining lower bits are assumed to be all 1s. S/W Programming Model restriction: Address ranges in the four pairs of PWBASE/LIMIT registers can be overlapping. S/W must not update this field when PW0/1/2/3_EN is set.
9:0	0x0 RO	**Reserved0:**

7.11.27 reg_MMIOSCUASSISTREG0_type (MMIOSCUASSISTREG0)—Offset 150h

These Region registers define a set of MMIO ranges that may be handled via SCU assist. The address and size are both 1KB aligned. Each region is enabled by MMIO_SCU_REGION_EN. The regions are used only when MMIO_IPC_EN is set.

Access Method

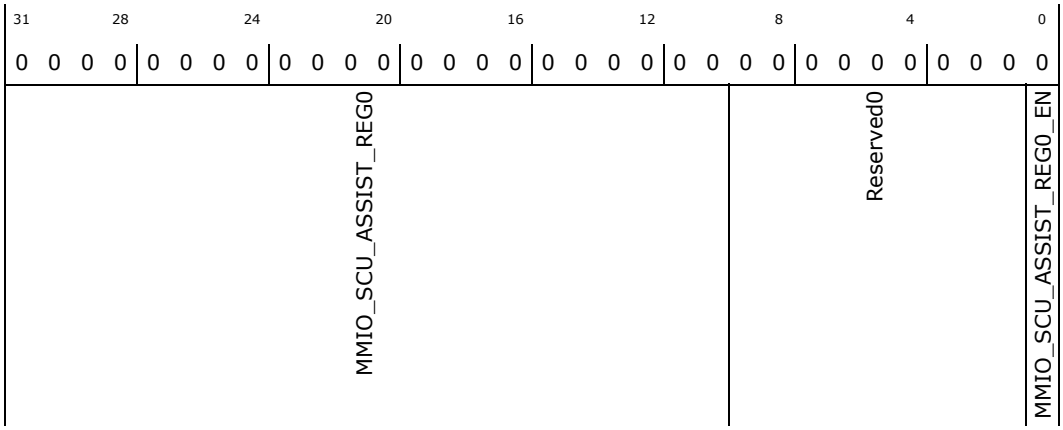
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 150h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**MMIO_SCU_ASSIST_REG0:** Address of 1K size region to which, if an MMIO cycle hits and corresponding MMIO_SCU_REGION_EN 0/1/2/3 is set, the cycle is forwarded to SCU as an IPC message. S/W Programming Model restriction: S/W must not update this field when MMIO_SCU_REGION_EN 0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RW	**MMIO_SCU_ASSIST_REG0_EN:** When set, Address region defined by MMIO_SCU_ASSIST_REGION 0/1/2/3 is valid. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress

7.11.28 reg_MMIOSCUASSISTREG1_type (MMIOSCUASSISTREG1)—Offset 154h

These Region registers define a set of MMIO ranges that may be handled via SCU assist. The address and size are both 1KB aligned. Each region is enabled by MMIO_SCU_REGION_EN. The regions are used only when MMIO_IPC_EN is set.

Access Method

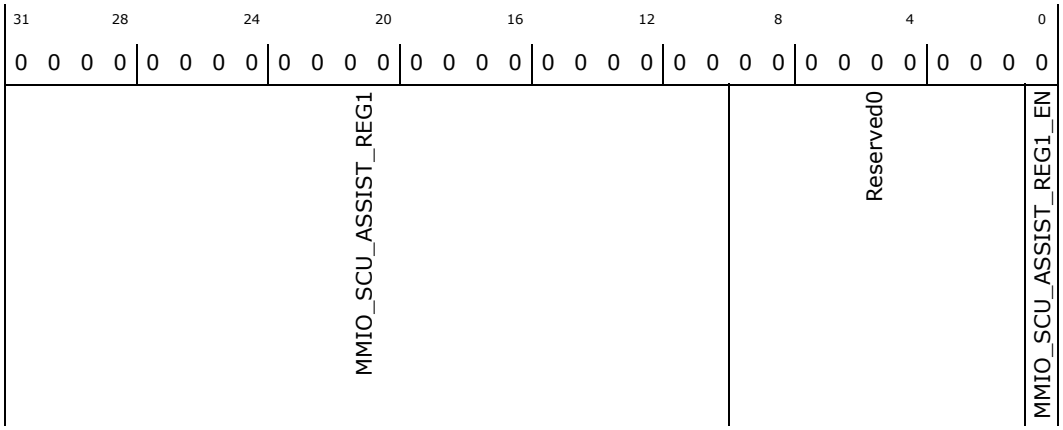
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 154h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**MMIO_SCU_ASSIST_REG1:** Address of 1K size region to which, if an MMIO cycle hits and corresponding MMIO_SCU_REGION_EN 0/1/2/3 is set, the cycle is forwarded to SCU as an IPC message. S/W Programming Model restriction: S/W must not update this field when MMIO_SCU_REGION_EN 0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RW	**MMIO_SCU_ASSIST_REG1_EN:** When set, Address region defined by MMIO_SCU_ASSIST_REGION 0/1/2/3 is valid. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress

7.11.29 reg_MMIOSCUASSISTREG2_type (MMIOSCUASSISTREG2)—Offset 158h

These Region registers define a set of MMIO ranges that may be handled via SCU assist. The address and size are both 1KB aligned. Each region is enabled by MMIO_SCU_REGION_EN. The regions are used only when MMIO_IPC_EN is set.

Access Method

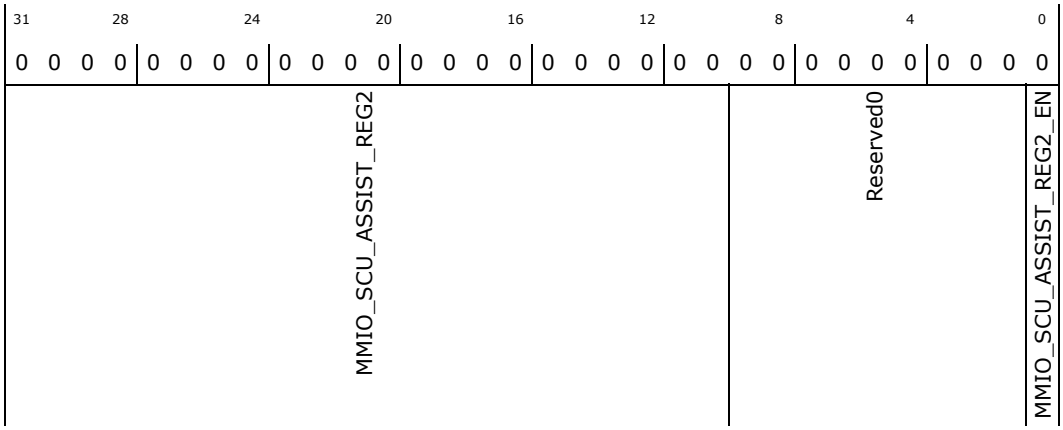
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 158h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**MMIO_SCU_ASSIST_REG2:** Address of 1K size region to which, if an MMIO cycle hits and corresponding MMIO_SCU_REGION_EN 0/1/2/3 is set, the cycle is forwarded to SCU as an IPC message. S/W Programming Model restriction: S/W must not update this field when MMIO_SCU_REGION_EN 0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RW	**MMIO_SCU_ASSIST_REG2_EN:** When set, Address region defined by MMIO_SCU_ASSIST_REGION 0/1/2/3 is valid. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress

7.11.30 reg_MMIOSCUASSISTREG3_type (MMIOSCUASSISTREG3)—Offset 15Ch

These Region registers define a set of MMIO ranges that may be handled via SCU assist. The address and size are both 1KB aligned. Each region is enabled by MMIO_SCU_REGION_EN. The regions are used only when MMIO_IPC_EN is set.

Access Method

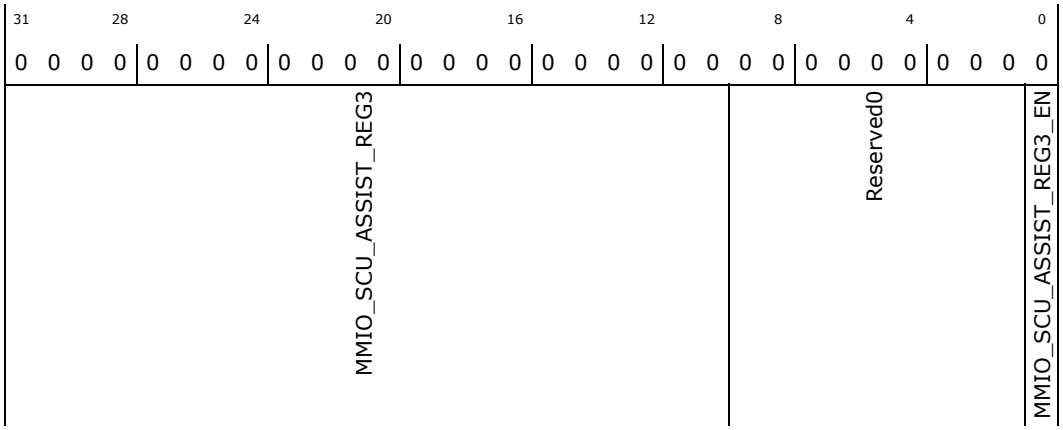
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 15Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**MMIO_SCU_ASSIST_REG3:** Address of 1K size region to which, if an MMIO cycle hits and corresponding MMIO_SCU_REGION_EN 0/1/2/3 is set, the cycle is forwarded to SCU as an IPC message. S/W Programming Model restriction: S/W must not update this field when MMIO_SCU_REGION_EN 0/1/2/3_EN is set.
9:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RW	**MMIO_SCU_ASSIST_REG3_EN:** When set, Address region defined by MMIO_SCU_ASSIST_REGION 0/1/2/3 is valid. S/W Programming Model restriction: S/W can change this bit while downstream traffic is in progress

7.11.31 reg_PMCTL_type (PMCTL)—Offset 1E0h

This register controls Power Management function of Bridge.

Access Method

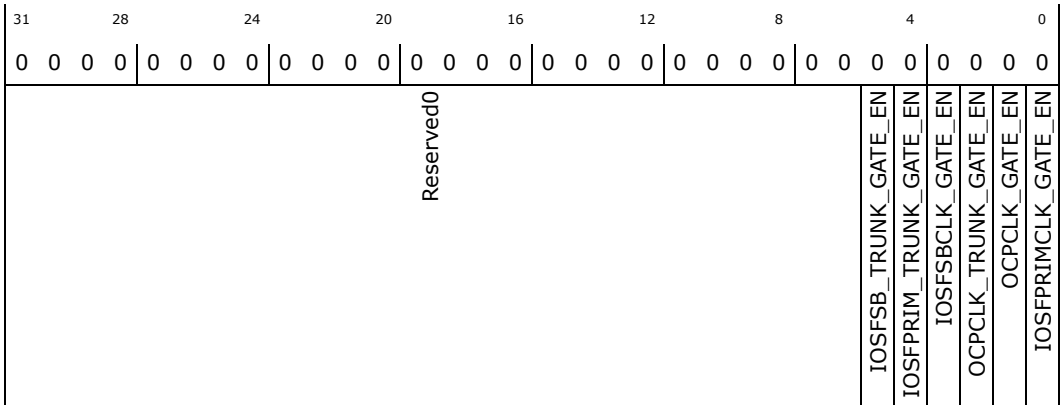
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 1E0h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved0:** Reserved.
5	0x0 RW	**IOSFSB_TRUNK_GATE_EN:** Reserved.
4	0x0 RW	**IOSFPRIM_TRUNK_GATE_EN:** Reserved.
3	0x0 RW	**IOSFSBCLK_GATE_EN:** Reserved.
2	0x0 RW	**OCPCLK_TRUNK_GATE_EN:** Enable OCP clock trunk gating. When set, OCP tunck clock gating functionality is enabled. S/W could change this bit on the fly even when Bridge is servicing cycles.
1	0x0 RW	**OCPCLK_GATE_EN:** Enable OCP clock gating functionality inside Bridge. When set, OCP clock gating functionality is enabled. S/W could change this bit on the fly even when Bridge is servicing cycles
0	0x0 RW	**IOSFPRIMCLK_GATE_EN:** Disable IOSF clock gating functionality inside Bridge. When set, IOSF clock gating functionality is disabled. S/W could change this bit on the fly while downstream traffic is in progress. Note: polarity of this bit is different than that of similar bit for OCP clock.

7.11.32 reg_DEBUGCTL_type (DEBUGCTL)—Offset 200h

This register has bits that controls various debug features.

Access Method

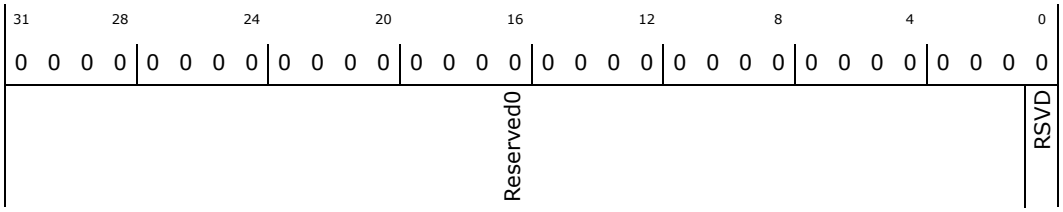
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 200h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved0:** Reserved.
0	0x0 RO	**Reserved (RSVD):** Reserved.

7.11.33 reg_DEBUGSTS_type (DEBUGSTS)—Offset 280h

Access Method

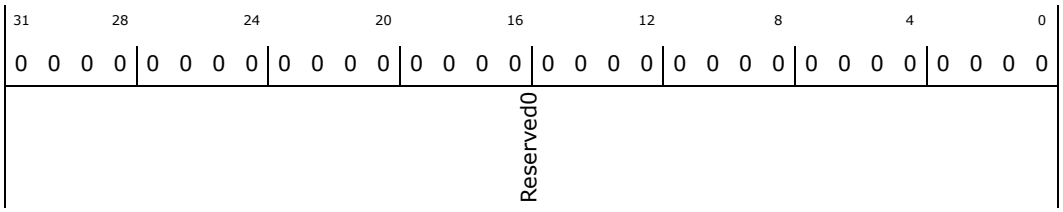
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 280h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved0:** Reserved.

7.11.34 reg_IOCFGCTL_type (IOCFGCTL)—Offset 400h

This register has bits that control various features and mechanisms associated with support for IO and PCI Config cycles functionality. This register is expected to be programmed by SCU during boot time.

Access Method

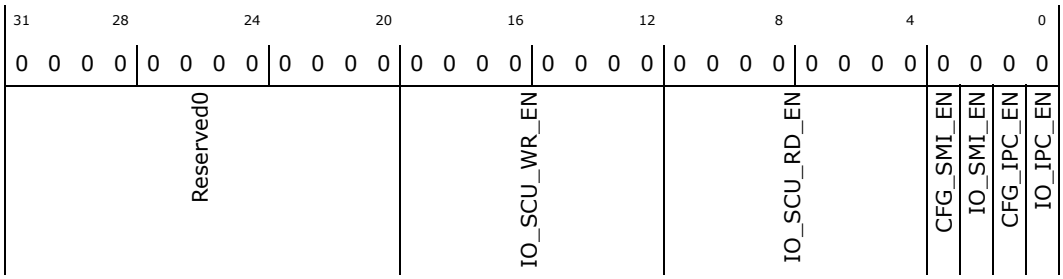
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 400h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**Reserved0:** Reserved.
19:12	0x0 RW	**IO_SCU_WR_EN:** O_SCU_WR_EN: Enable I/O writes that fall in the corresponding IO_SCU_ASSIST_REGION to be handled by the SCU. These bits are only valid when IO_IPC_EN is set. Bit12 corresponds to IO_SCU_ASSIST_REGION0 while bit19 corresponds to IO_SCU_ASSIST_REGION7.
11:4	0x0 RW	**IO_SCU_RD_EN:** IO_SCU_RD_EN: Enable I/O reads that fall in the corresponding IO_SCU_ASSIST_REGION to be handled by the SCU. These bits are only valid when IO_IPC_EN is set. Bit4 corresponds to IO_SCU_ASSIST_REGION0 while bit 11 corresponds to IO_SCU_ASSIST_REGION7.
3	0x0 RW	**CFG_SMI_EN:** When set and when IO_IPC_EN is set, Bridge generates an SMI# as a VLW when SCU writes a Unsuccessful Status (i.e. a 1) in UP_BRIDGE_CMD bit for a Config request. When set and when CFG_IPC_EN is cleared, Bridge generates an SMI# as a VLW when Bridge receives a Config request.
2	0x0 RW	**IO_SMI_EN:** When set and when IO_IPC_EN is set, Bridge generates an SMI# as a VLW when SCU writes a Unsuccessful Status (i.e. a 1) in UP_BRIDGE_CMD bit for an IO request. When set and when IO_IPC_EN is cleared, Bridge generates an SMI# as a VLW when Bridge receives an IO request.
1	0x0 RW	**CFG_IPC_EN:** When set, Bridge sends an IPC message to SCU upon receiving a Config request. When cleared, Bridge returns a completion with Unsuccessful Status on IOSF Primary Channel.
0	0x0 RW	**IO_IPC_EN:** When set, Bridge sends an IPC message to SCU upon receiving an IO request. When cleared, Bridge returns a completion with Unsuccessful Status on IOSF Primary Channel.

7.11.35 reg_UPBRIDGEDATA_type (UPBRIDGEDATA)—Offset 408h

The 32b UP_BRIDGE_DATA is written to by SCU via Thread3 and contains data associated with command written to UP_BRIDGE_CMD register. SCU writes to this register on Thread3 as part of actions it takes for IO or Config read request. When completion status is Successful, Bridge returns this as read data along with IO or Config read completion. It is expected as part of normal usage model that IA never writes or reads this register - though there is no hardware to prevent this. A read to this register from OCP Fabric results in undefined behavior.

Access Method

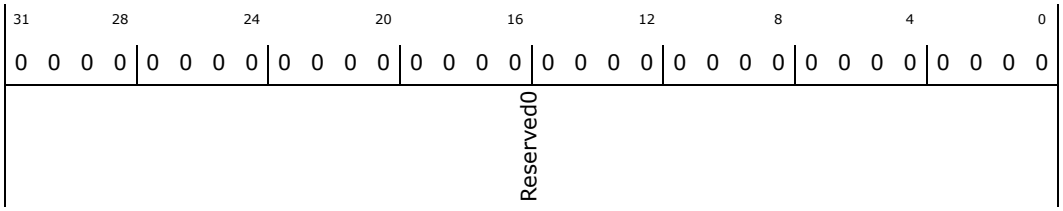
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 408h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved0:** Reserved.

7.11.36 reg_UPBRIDGECMD_type (UPBRIDGECMD)—Offset 410h

This register is written to by SCU and contains command for the Bridge. A read to this register from OCP fabric results in undefined behavior

Access Method

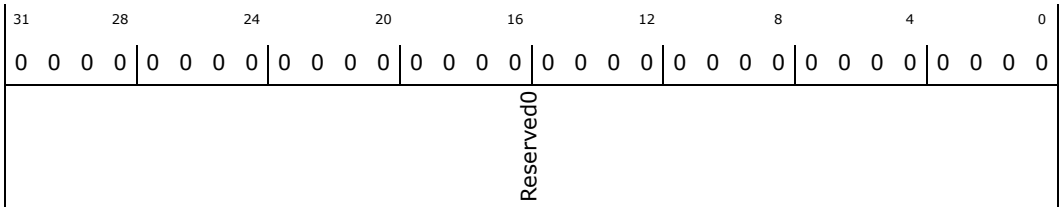
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 410h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Reserved0:** SCU writes to this register on Thread3 as part of actions it takes for IO or Config read request. 0x00: Indicates Bridge should return a completion with Successful status for the IO or Config request. 0x01: Indicates Bridge should return a completion with Unsuccessful status for the IO or Config request. Other encodings are reserved. It is expected as part of normal usage model that IA never writes or reads this register - though there is no hardware to prevent this.

7.11.37 reg_ILBCTL_type (ILBCTL)—Offset 414h

This register has bits that control various features and mechanisms associated ILB (Intel Legacy Block). This register is expected to be programmed by SCU during boot time.

Access Method

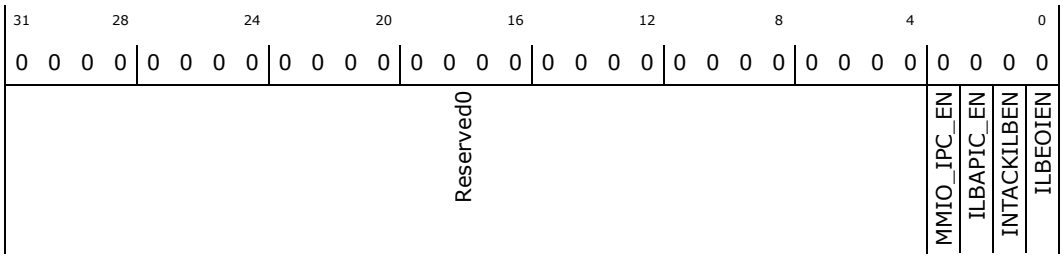
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 414h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved0:** Reserved.
3	0x0 RW	**MMIO_IPC_EN:** When set, Bridge sends an IPC message to SCU upon receiving a MMIO request that hits an enabled regions defined by MMIO_SCU_REGION registers.
2	0x0 RW	**ILBAPIC_EN:** When set, APIC requests are not forwarded to SCU but sent to ILB on Thread0. When reset, APIC requests are forwarded to SCU.
1	0x0 RW	**INTACKILBEN:** When set, Bridge forwards INT_ACK from IA towards ILB on Thread 0 of OCP Fabric. This behavior is independent of setting of IO_IPC_EN bit. When reset, Bridge may forward INT_ACK towards SCU as IPC message if IO_IPC_EN = 1 and IO_SMI_EN = 0.
0	0x0 RW	**ILBEOIEN:** When set, Bridge forwards EOI from IOSF Primary as a memory write on Thread 0 towards ILB on OCP fabric. When reset, Bridge forwards EOI as an IPC to SCU.

7.11.38 reg_INTACKBASE_type (INTACKBASE)—Offset 418h

This register provides memory address to which OCP Bridge forwards INT_ACK cycle from IA as a 1B memory read request. This register is expected to be programmed by SCU during boot time.

Access Method

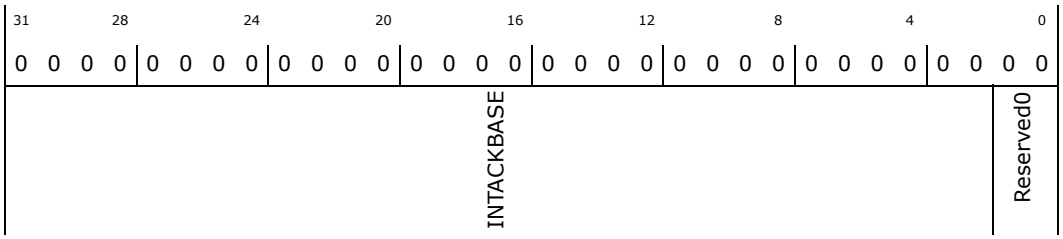
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 418h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**INTACKBASE:** Base memory address to which INT_ACK from IA would be forwarded to as a 1B memory read request. SW Programming Model restriction: Even though register is RW until address bit 2, it is expected that this register would be aligned to 4K address boundary.
1:0	0x0 RO	**Reserved0:** Reserved.

7.11.39 reg_SMICMD_type (SMICMD)—Offset 420h

Bridge stores the command that caused SMI#.

Access Method

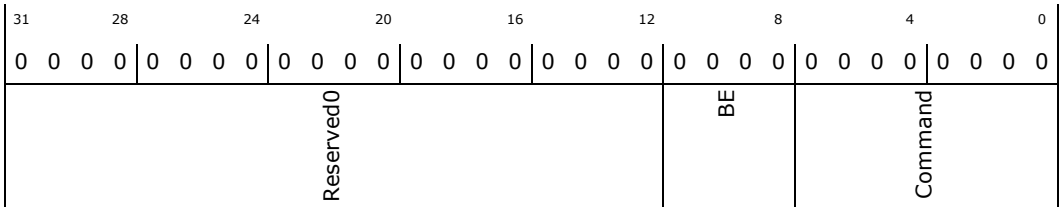
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 420h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x0 RO	**BE:** Bridges stores, in this field, active high First DW Byte Enables associated with the IO or Config request that caused the SMI.
7:0	0x0 RO	**Command:** Bridges stores, in this field, IO or Config request that caused the SMI. Encodings: 0x00: IO read 0x01: IO write 0x02: Config Type0 read 0x03: Config Type0 write 0x04: Config Type1 read 0x05: Config Type1 write

7.11.40 reg_SMIADDR_type (SMIADDR)—Offset 424h

Bridge stores the address of the IO or Config request that caused the SMI#.

Access Method

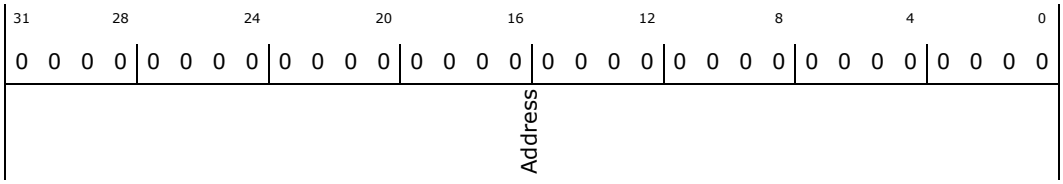
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 424h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Address:** Bridges stores, in this field, address of the IO or Config request that caused the SMI. In case of an IO request, only lower 16b are valid. For Config requests, see table above for information conveyed by various address fields.

7.11.41 reg_SMIDATA_type (SMIDATA)—Offset 428h

Bridge stores the data associated with the IO or Config request that caused the SMI#.

Access Method

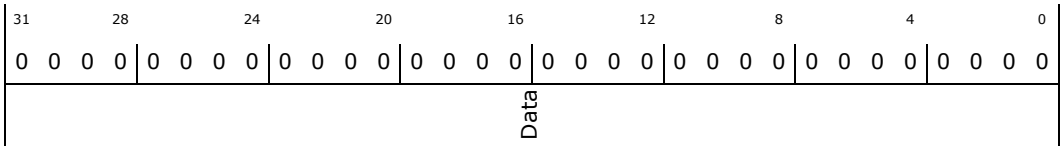
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 428h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data:** Bridges stores, in this field, data of the IO or Config request that caused the SMI.

7.11.42 reg_SMISTS_type (SMISTS)—Offset 42Ch

Bridge stores the status of SMI#. Refer section Detailed flow of emulation of legacy IO and Config Cycles

Access Method

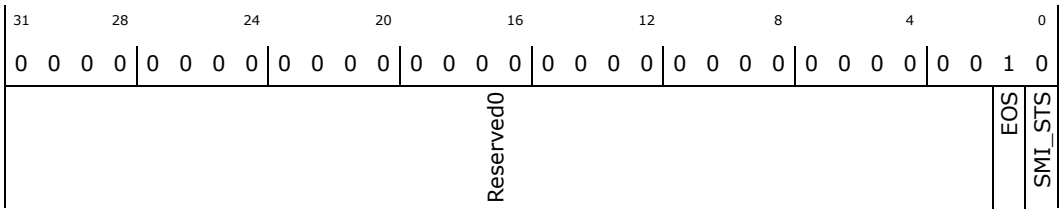
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 42Ch

Op Codes:

h - Read, h - Write

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1	0x1 RW/S	**EOS:** End of SMI#. Bridge clears this bit when it launches an SMI#. IA-CPU writes a 1 to this bit to set it
0	0x0 RW/1C	**SMI_STS:** This bit is set by h/w. When set and EOS bit is also set, Bridge launches an SMI# on IOSF Sideband Channel. IA-CPU writes a 1 to this bit to clear the bit.

7.11.43 reg_IOSCUASSISTREG0_type (IOSCUASSISTREG0)—Offset 430h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

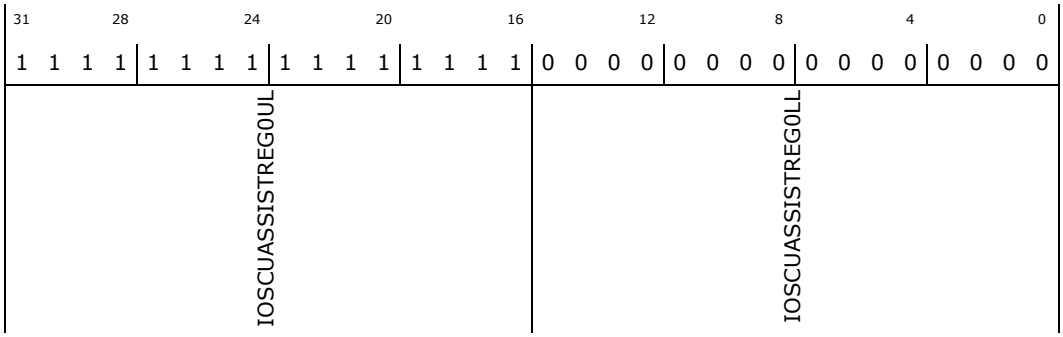
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 430h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG0UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG0LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.44 reg_IOSCUASSISTREG1_type (IOSCUASSISTREG1)—Offset 434h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

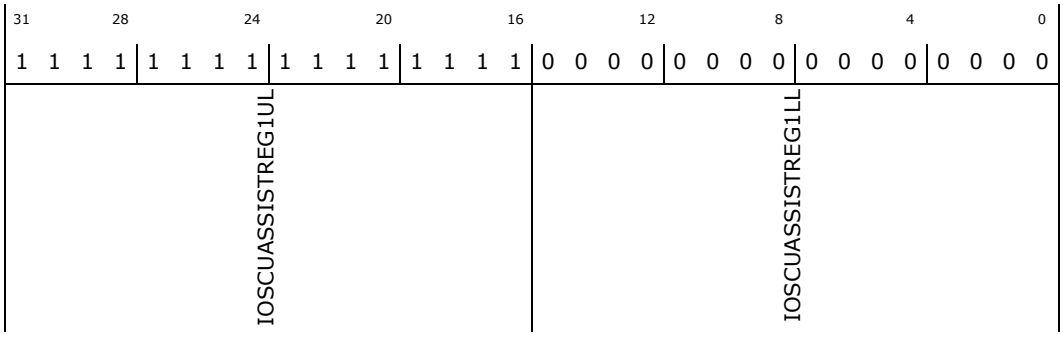
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 434h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG1UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG1LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.45 reg_IOSCUASSISTREG2_type (IOSCUASSISTREG2)—Offset 438h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

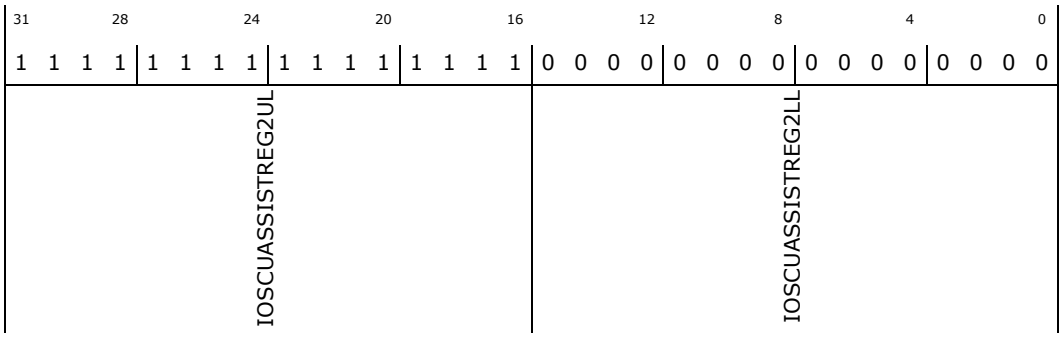
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 438h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG2UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG2LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.46 reg_IOSCUASSISTREG3_type (IOSCUASSISTREG3)—Offset 43Ch

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

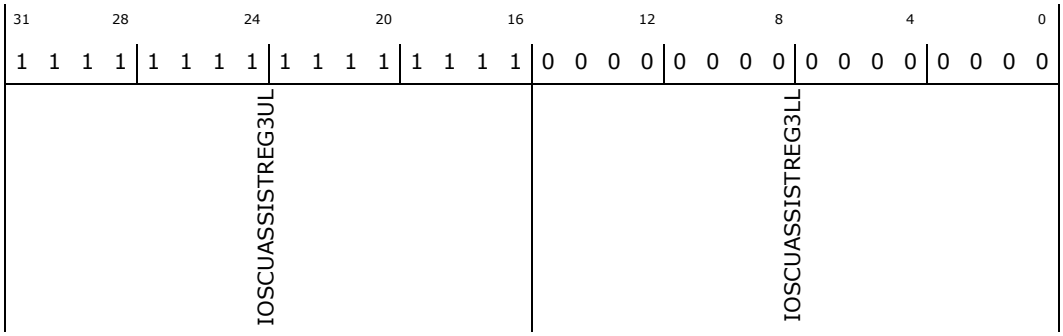
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 43Ch

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG3UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG3LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.47 reg_IOSCUASSISTREG4_type (IOSCUASSISTREG4)—Offset 440h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the

IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

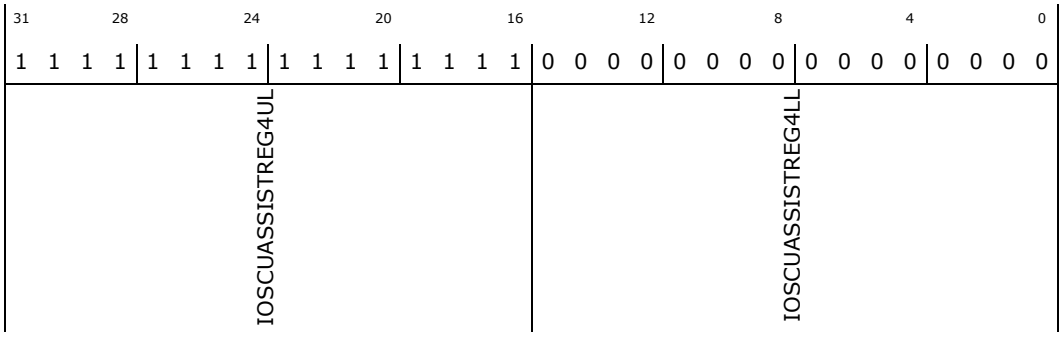
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 440h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG4UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG4LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.48 reg_IOSCUASSISTREG5_type (IOSCUASSISTREG5)—Offset 444h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

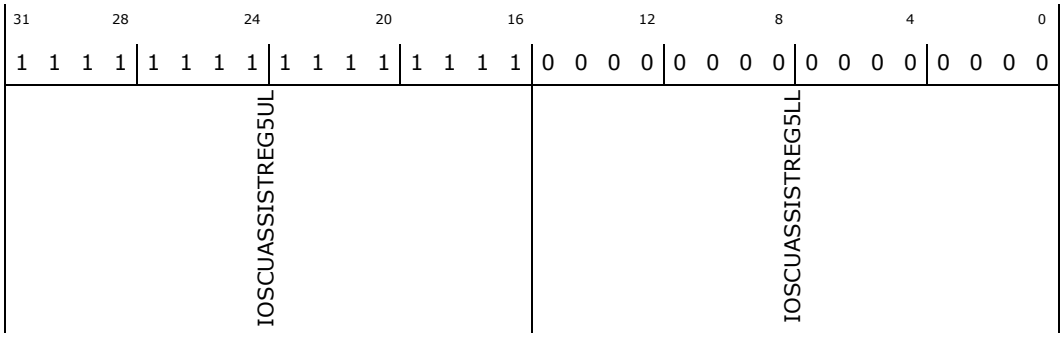
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 444h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG5UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG5LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.49 reg_IOSCUASSISTREG6_type (IOSCUASSISTREG6)—Offset 448h

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

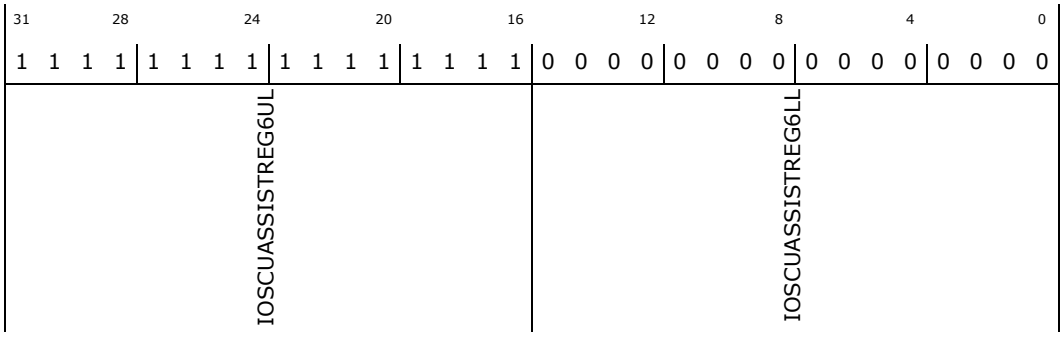
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 448h

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG6UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG6LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.50 reg_IOSCUASSISTREG7_type (IOSCUASSISTREG7)—Offset 44Ch

These Region registers define a set of I/O ranges that may be handled via SCU assist. The address is byte granular and the range may be from 1 Byte to the entire 64KB I/O address range. The regions are enabled when IO_IPC_EN is set, IO_SMI_EN is clear and: For writes, corresponding IOCFGCTL. IO_SCU_WR_EN is set For reads, corresponding IOCFGCTL. IO_SCU_RD_EN is set These registers are byte granular. If all the enabled bytes in the incoming IO Cycle fall wholly within the defined region, the IO cycle is a candidate for trapping. If SCU Assist is enabled, and the cycle does not match any of the region registers, it is forwarded onto the ILB - see section on IO and Config handling for PC-Linux support.

Access Method

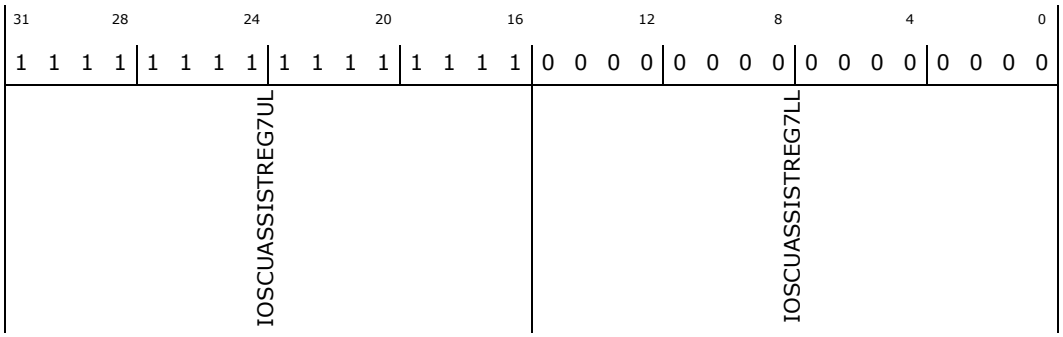
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 44Ch

Op Codes:

h - Read, h - Write

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RW	**IOSCUASSISTREG7UL:** IO_SCU_ASSIST_REGION_U0: Upper IO Address for Region 0/1/2/3/4/5/6/7
15:0	0x0 RW	**IOSCUASSISTREG7LL:** IO_SCU_ASSIST_REGION_L0: Lower IO Address for Region 0/1/2/3/4/5/6/7

7.11.51 reg_PCICFGCTR1_type (PCICFGCTR1)—Offset 500h

This register defines functionality for PCI Config space 1

Access Method

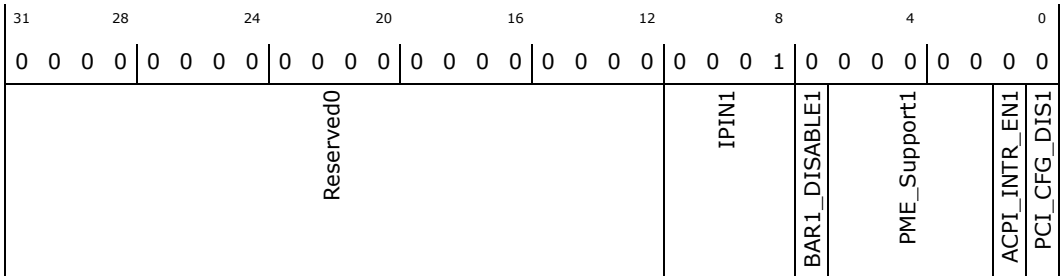
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 500h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN1:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE1:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support1:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN1:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS1:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.52 reg_PCICFGCTR2_type (PCICFGCTR2)—Offset 504h

This register defines functionality for PCI Config space 1

Access Method

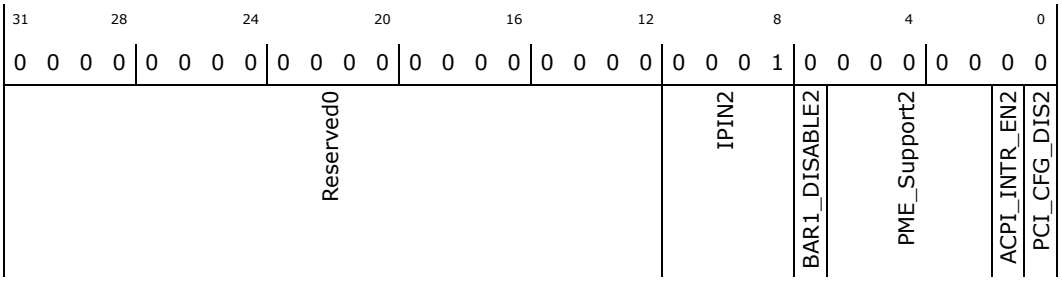
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 504h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN2:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE2:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support2:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN2:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS2:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.53 reg_PCICFGCTR3_type (PCICFGCTR3)—Offset 508h

This register defines functionality for PCI Config space 1

Access Method

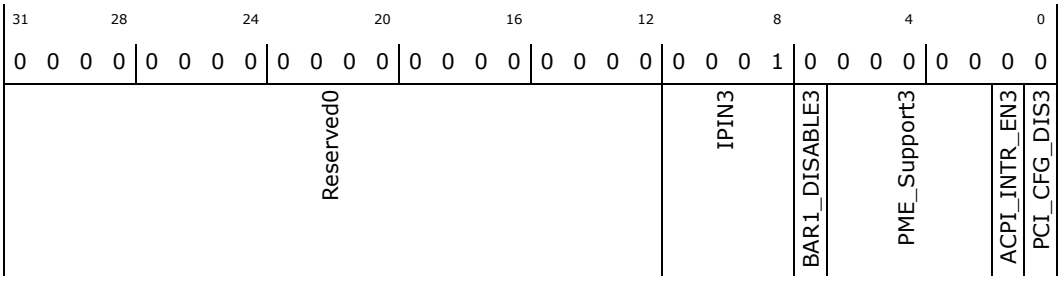
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 508h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN3:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE3:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support3:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN3:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS3:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.54 reg_PCICFGCTR4_type (PCICFGCTR4)—Offset 50Ch

This register defines functionality for PCI Config space 1

Access Method

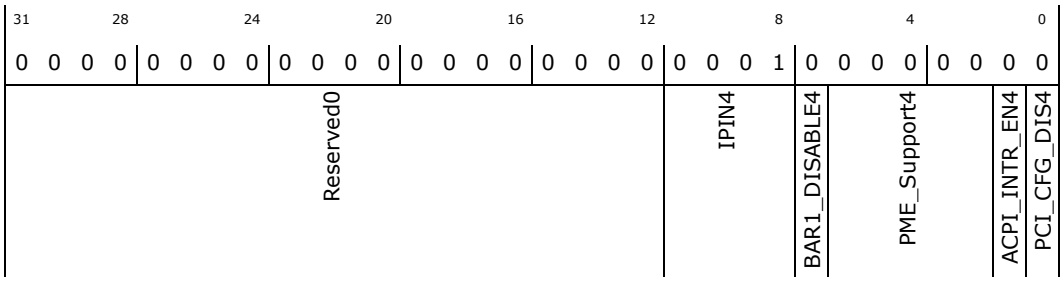
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 50Ch

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN4:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**BAR1_DISABLE4:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support4:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN4:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS4:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.55 reg_PCICFGCTR5_type (PCICFGCTR5)—Offset 510h

This register defines functionality for PCI Config space 1

Access Method

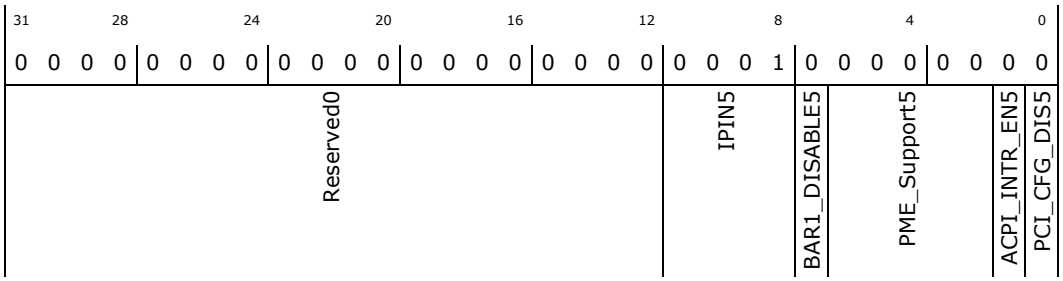
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 510h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN5:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE5:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support5:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**ACPI_INTR_EN5:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS5:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.56 reg_PCICFGCTR6_type (PCICFGCTR6)—Offset 514h

This register defines functionality for PCI Config space 1

Access Method

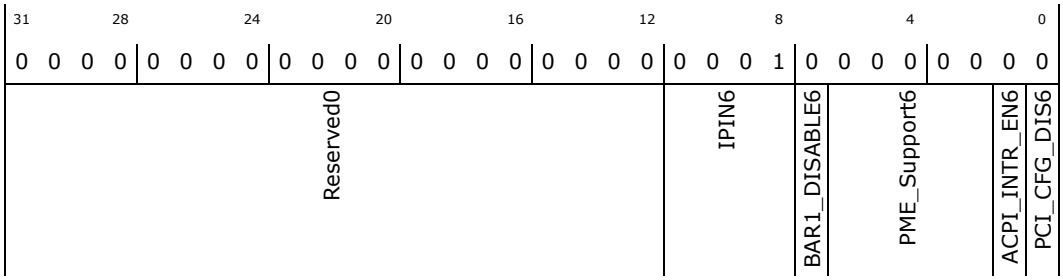
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 514h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN6:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE6:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support6:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN6:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS6:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.57 reg_PCICFGCTR7_type (PCICFGCTR7)—Offset 518h

This register defines functionality for PCI Config space 1

Access Method

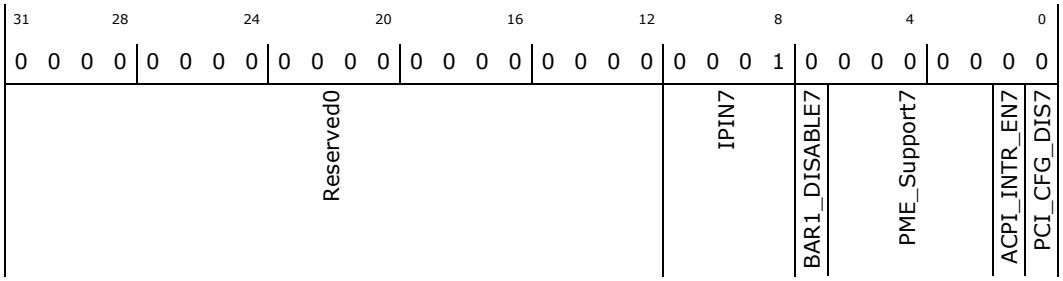
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 518h

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN7:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE7:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support7:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN7:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS7:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.58 reg_PCICFGCTR8_type (PCICFGCTR8)—Offset 51Ch

This register defines functionality for PCI Config space 1

Access Method

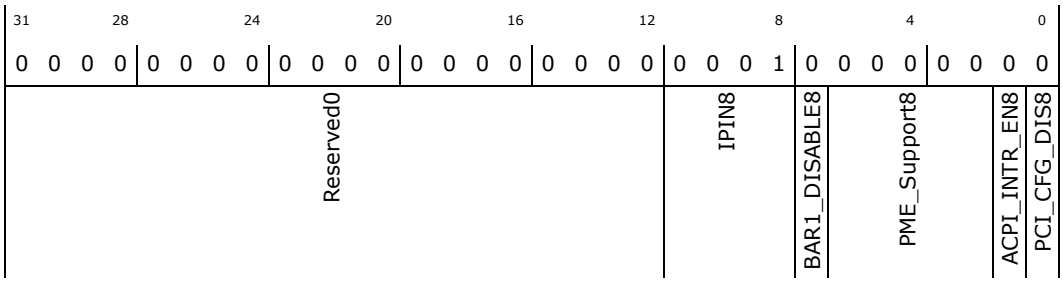
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 51Ch

Op Codes:

h - Read, h - Write

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RW	**IPIN8:** This register indicates the value to be reflected in the IPIN register of the PCI configuration space. 0- No Interrupt, 1- INTA, 2-INTB, 3-INTC, 4-INTD
7	0x0 RW	**BAR1_DISABLE8:** BAR1 register in the PCI config space will become read only 0 when this bit is set, else this register will be RW. This bit also affects decode for BAR1 accesses
6:2	0x0 RW	**PME_Support8:** The value in this register will be XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space. This register can be used as a mechanism to change the value of the PME_Status PCI config register field
1	0x0 RW	**ACPI_INTR_EN8:** When set, Bridge will use ACPI SB opcodes for messages. When cleared, Bridge will use global IOSF opcodes
0	0x0 RW	**PCI_CFG_DIS8:** When set, PCI configuration accesses return UR response. When 0, PCI configuration accesses are supported

7.11.59 reg_CHCTRL_type (CHCTRL)—Offset 520h

Access Method

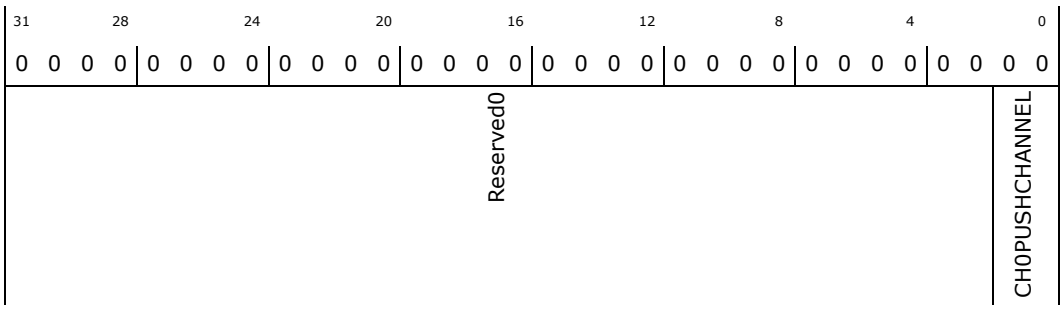
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 520h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved0:** Reserved.
1:0	0x0 RW	**CH0PUSHCHANNEL:** Reserved.

7.11.60 reg_PRI_GEN_REGRW1_type (PRI_GEN_REGRW1)—Offset 600h

General Purpose Read Write Register 1

Access Method

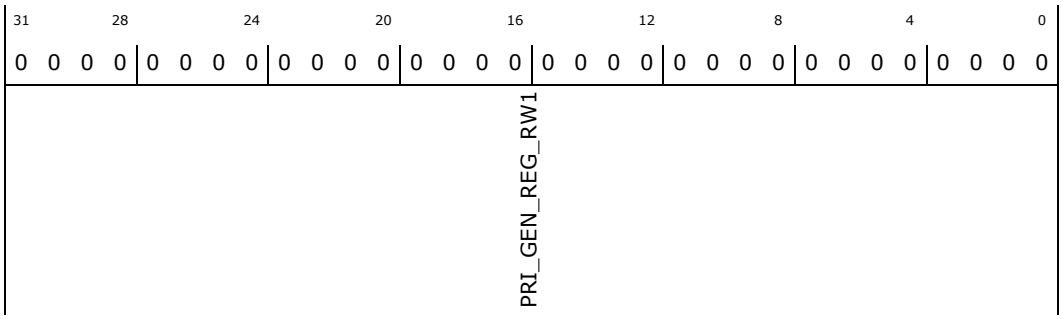
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 600h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW1:** This is a generic register provided for product specific behavior

7.11.61 reg_PRI_GEN_REGRW2_type (PRI_GEN_REGRW2)—Offset 604h

General Purpose Read Write Register 2

Access Method

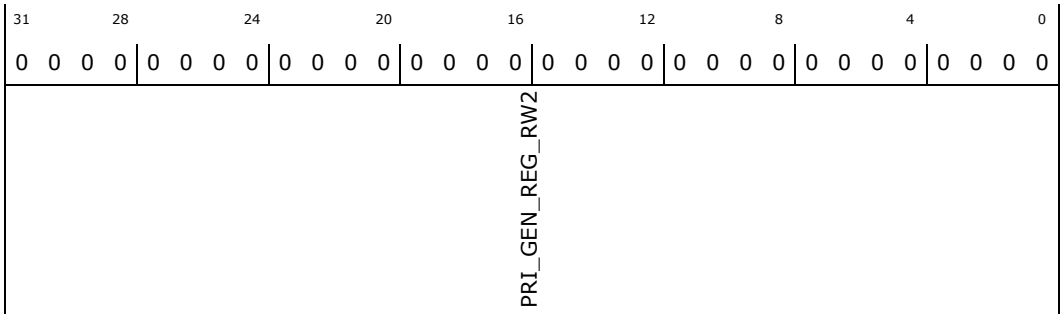
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 604h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW2:** This is a generic register provided for product specific behavior

7.11.62 reg_PRI_GEN_REGRW3_type (PRI_GEN_REGRW3)—Offset 608h

General Purpose Read Write Register 3

Access Method

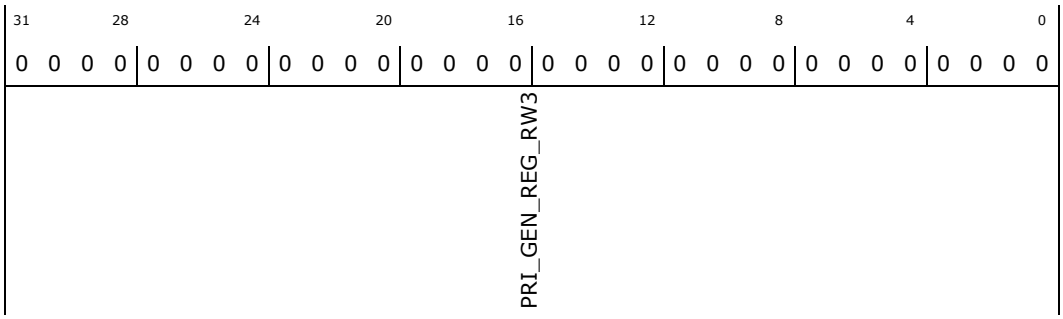
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 608h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW3:** This is a generic register provided for product specific behavior

7.11.63 reg_PRI_GEN_REGRW4_type (PRI_GEN_REGRW4)—Offset 60Ch

General Purpose Read Write Register 4

Access Method

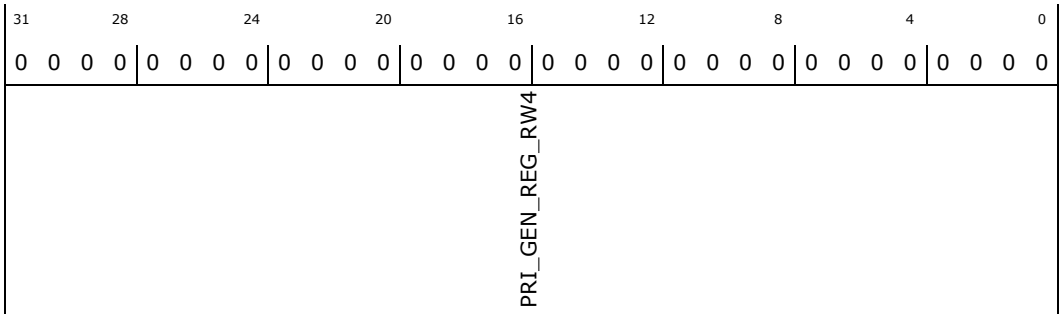
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 60Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW4:** This is a generic register provided for product specific behavior

7.11.64 reg_PRI_GEN_REGRW5_type (PRI_GEN_REGRW5)—Offset 610h

General Purpose Read Write Register 5

Access Method

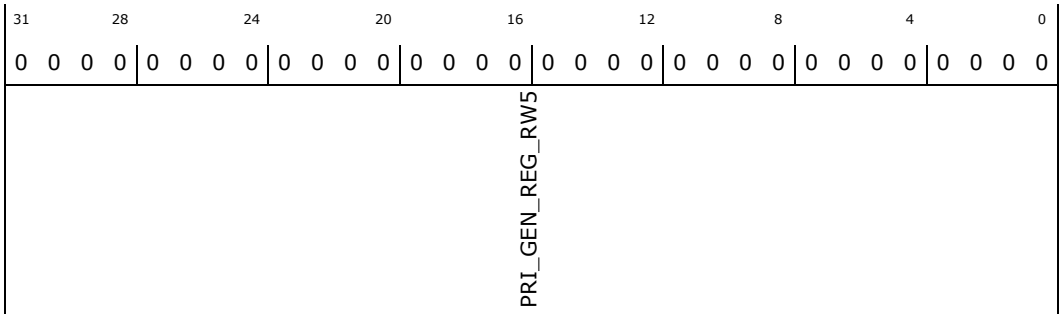
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 610h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW5:** This is a generic register provided for product specific behavior

7.11.65 reg_PRI_GEN_REGRW6_type (PRI_GEN_REGRW6)—Offset 614h

General Purpose Read Write Register 6

Access Method

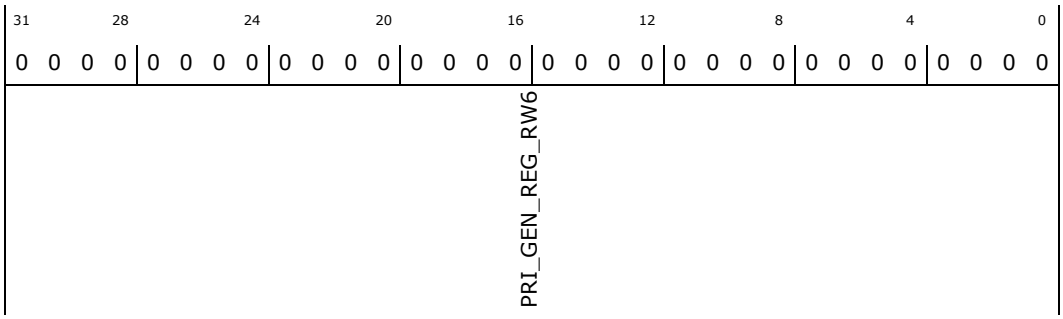
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 614h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW6:** This is a generic register provided for product specific behavior

7.11.66 reg_PRI_GEN_REGRW7_type (PRI_GEN_REGRW7)—Offset 618h

General Purpose Read Write Register 7

Access Method

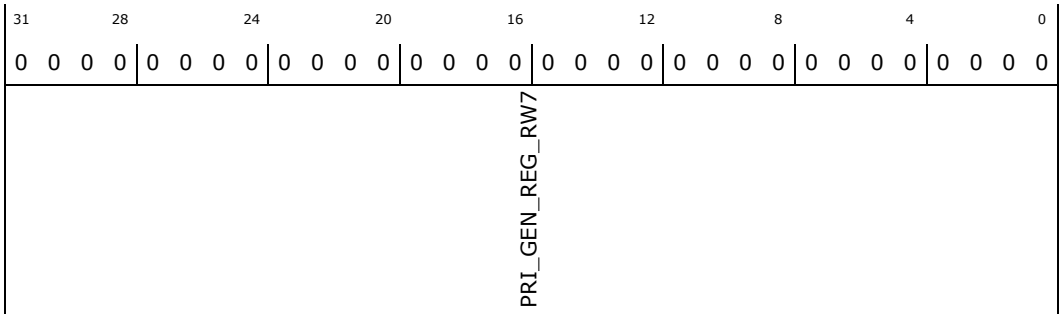
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 618h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW7:** This is a generic register provided for product specific behavior

7.11.67 reg_PRI_GEN_REGRW8_type (PRI_GEN_REGRW8)—Offset 61Ch

General Purpose Read Write Register 8

Access Method

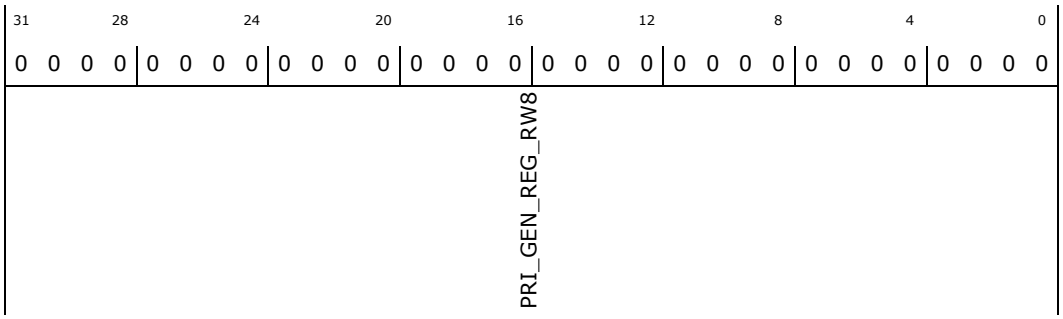
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 61Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**PRI_GEN_REG_RW8:** This is a generic register provided for product specific behavior

7.11.68 reg_PRI_GEN_REGRWO1_type (PRI_GEN_REGRWO1)—Offset 620h

General Purpose Read Write Once Register 1

Access Method

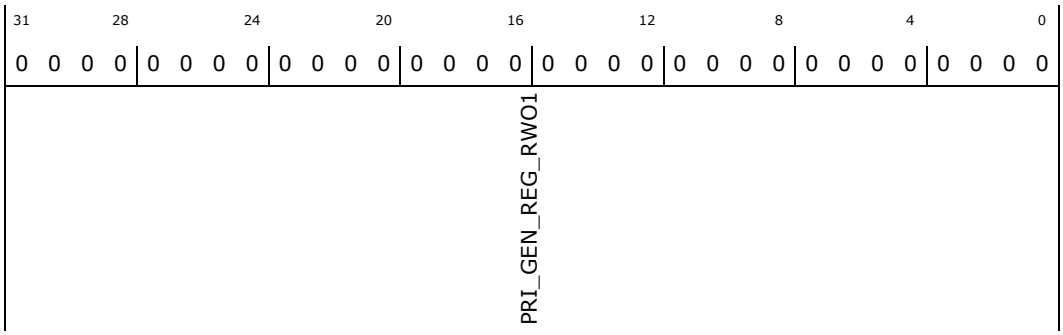
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 620h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO1:** This is a generic register provided for product specific behavior

7.11.69 reg_PRI_GEN_REGRWO2_type (PRI_GEN_REGRWO2)—Offset 624h

General Purpose Read Write Once Register 2

Access Method

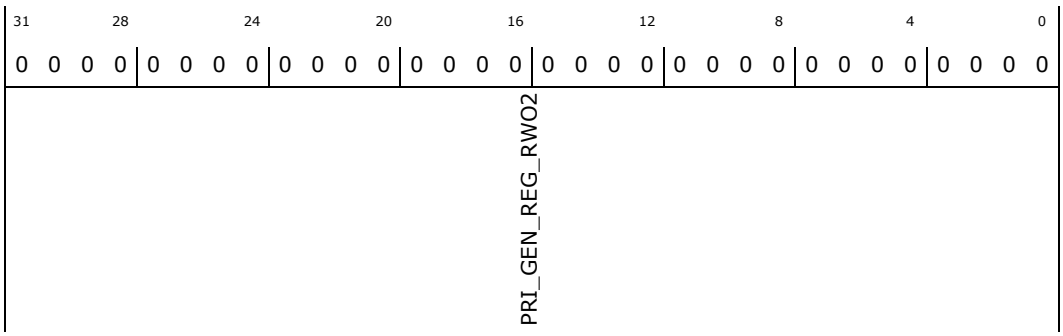
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 624h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO2:** This is a generic register provided for product specific behavior

7.11.70 reg_PRI_GEN_REGRWO3_type (PRI_GEN_REGRWO3)—Offset 628h

General Purpose Read Write Once Register 3

Access Method

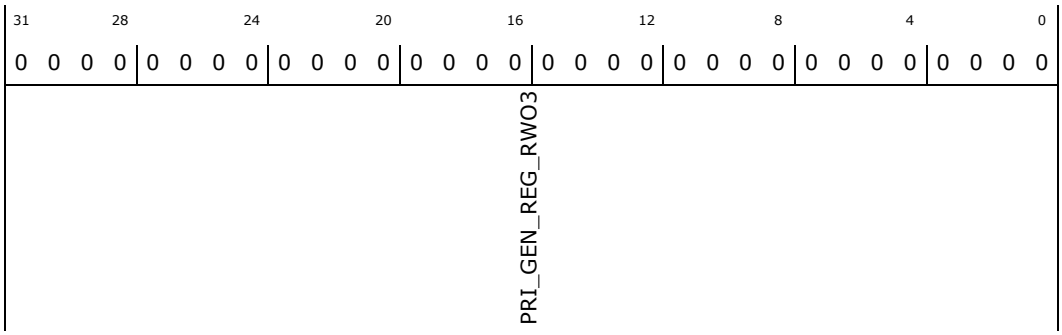
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 628h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO3:** This is a generic register provided for product specific behavior

7.11.71 reg_PRI_GEN_REGRWO4_type (PRI_GEN_REGRWO4)—Offset 62Ch

General Purpose Read Write Once Register 4

Access Method

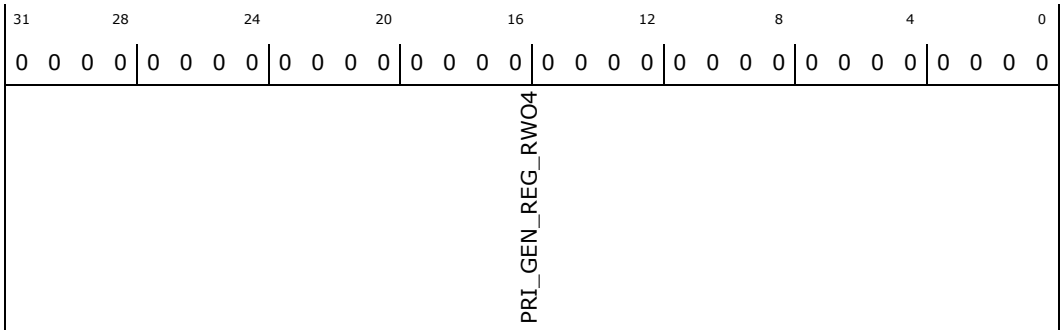
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 62Ch

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO4:** This is a generic register provided for product specific behavior

7.11.72 reg_PRI_GEN_REGRWO5_type (PRI_GEN_REGRWO5)—Offset 630h

General Purpose Read Write Once Register 5

Access Method

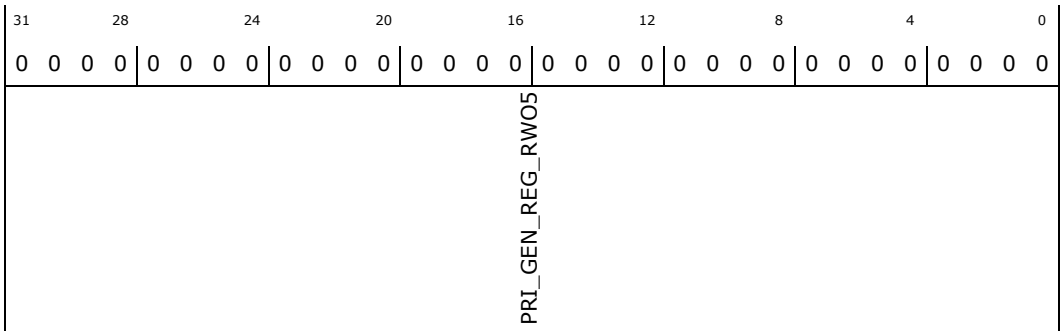
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 630h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO5:** This is a generic register provided for product specific behavior

7.11.73 reg_PRI_GEN_REGRWO6_type (PRI_GEN_REGRWO6)—Offset 634h

General Purpose Read Write Once Register 6

Access Method

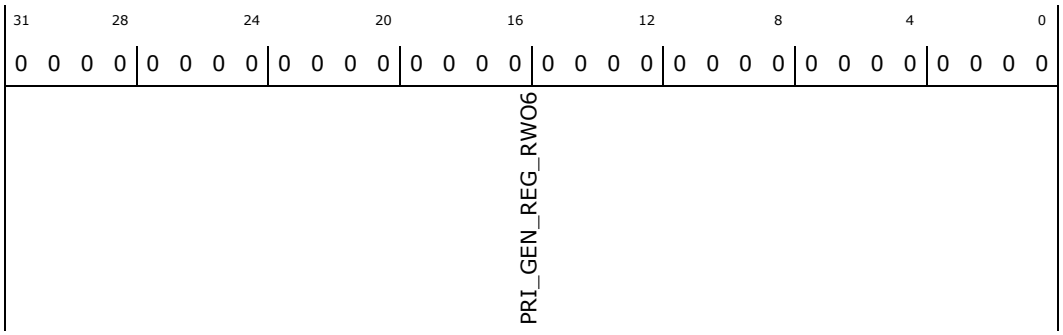
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 634h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO6:** This is a generic register provided for product specific behavior

7.11.74 reg_PRI_GEN_REGRWO7_type (PRI_GEN_REGRWO7)—Offset 638h

General Purpose Read Write Once Register 7

Access Method

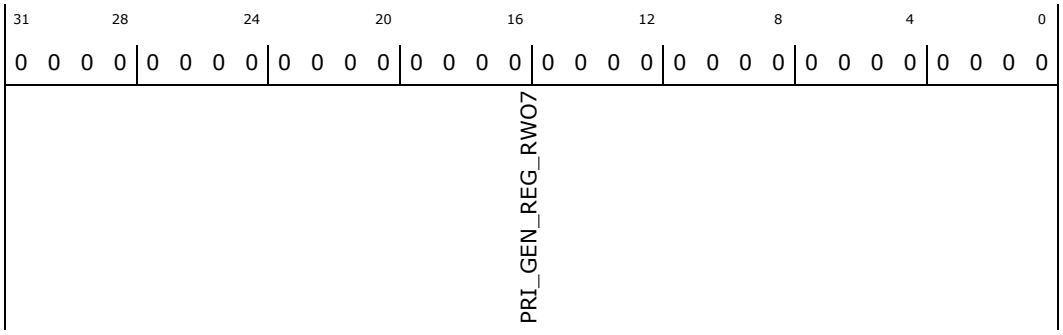
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 638h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO7:** This is a generic register provided for product specific behavior

7.11.75 reg_PRI_GEN_REGRWO8_type (PRI_GEN_REGRWO8)—Offset 63Ch

General Purpose Read Write Once Register 8

Access Method

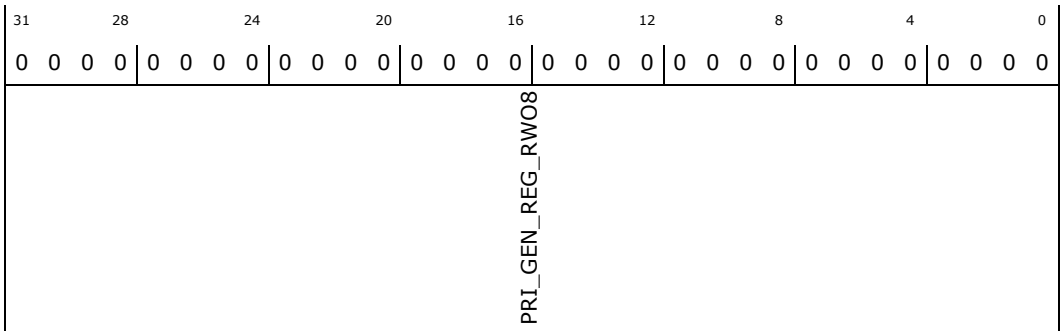
Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x59] + 63Ch

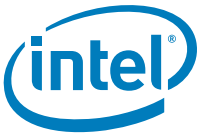
Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/O	**PRI_GEN_REG_RWO8:** This is a generic register provided for product specific behavior



7.12 USB OTG PCI Configuration Registers

Table 48. Summary of PCI Configuration Registers—0/22/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
A0–A3h	4	"reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h" on page 3077	00000000h
A4–A7h	4	"reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h" on page 3078	00000000h
A8–ABh	4	"reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h" on page 3079	00000000h
AC–AFh	4	"reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh" on page 3079	00000000h
C0–C3h	4	"reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h" on page 3080	1008000Bh

7.12.1 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

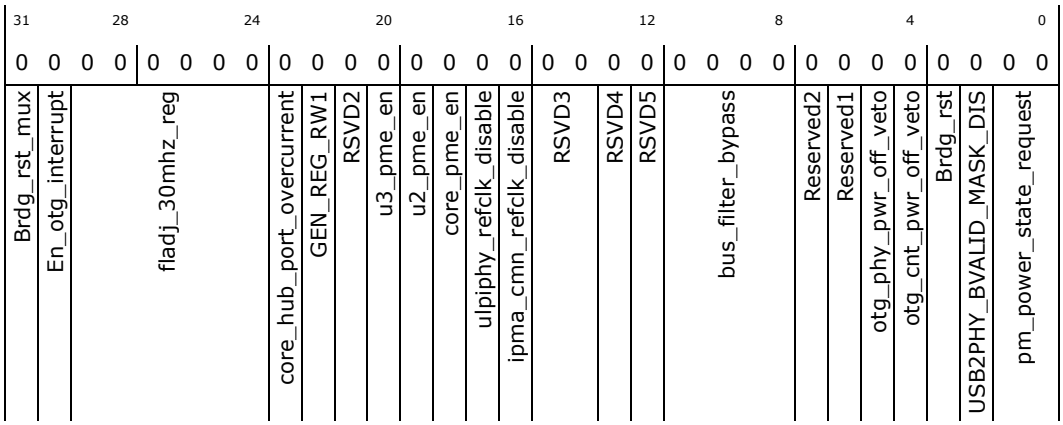
General Purpose Read Write Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Brdg_rst_mux:** This is a mux the core reset between the normal reset or reset and with bdg_reset regRW1[3]
30	0x0 RW	**En_otg_interrupt:** reserved
29:24	0x0 RW	**fladj_30mhz_reg:** HS jitter adjusment
23	0x0 RW	**core_hub_port_overcurrent:** This is a generic register provided for product specific behavior
22	0x0 RW	**GEN_REG_RW1:** This is a generic register provided for product specific behavior
21	0x0 RW	**RSVD2:** reserved
20	0x0 RW	**u3_pme_en:** Determines whether USB3 flis PME events are allowed to trigger PME events to brige/GPIO
19	0x0 RW	**u2_pme_en:** Determines whether ULPI flis PME events are allowed to trigger PME events to brige/GPIO
18	0x0 RW	**core_pme_en:** Determines whether core PME events are allowed to trigger PME events to brige/GPIO
17	0x0 RW	**ulpiphy_refclk_disable:** Feeds logic that generates the 19.2MHz clkreq signal
16	0x0 RW	**ipma_cmn_refclk_disable:** Feeds through PIMA PHY into 25MHz clkreq signal
15:14	0x0 RW	**RSVD3:** reserved

Bit Range	Default & Access	Field Name (ID): Description
13	0x0 RW	**RSVD4:** reserved
12	0x0 RW	**RSVD5:** reserved
11:8	0x0 RW	**bus_filter_bypass:** Bus Filter Bypass. Disables the internal bus filters that are enabled by DWC_USB3_EN_BUS_FILTERS coreConsultant parameter. This static signal is present only when DWC_USB3_EN_BUS_FILTERS is 1. It is expected that this signal is set or reset at power-on reset and is not changed during the normal operation of the core.
7	0x0 RW	**Reserved2:** reserved
6	0x0 RW	**Reserved1:** reserved
5	0x0 RW	**otg_phy_pwr_off_veto:** Indicates that PHY suspend power should not power off even on RTD3hot (Note that the PHY core power is turned off during RTD3hot in line with the OTG core, as a function of otg_cnt_pwr_off_veto)
4	0x0 RW	**otg_cnt_pwr_off_veto:** Indicates that controller power should not power off even on RTD3hot.Also a veto signal to keep LPPLL on. Note: Currently LPPLL results in a veto for S0iX flows
3	0x0 RW	**Brdg_rst:** reset the core see also regRW1[31]
2	0x0 RW	**USB2PHY_BVALID_MASK_DIS:** 0: enable USB2 PHY BVALID mask 1: disable
1:0	0x0 RW	**pm_power_state_request:** This port defines the PCI power management state requested by the software. When the core is configured with two power rail support (DWC_USB3_EN_PWROPT=2), the valid states are: ? 00: D0 ? 11: D3 Active State

7.12.2 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

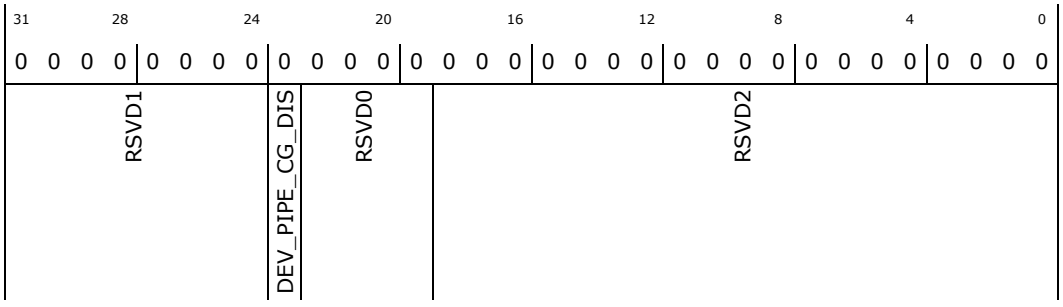
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**RSVD1:** RESERVED **Power Well:** SUS
23	0x0 RW	**DEV_PIPE_CG_DIS:** (SoC Only) chicken bit to disable pipe clock gating. 0 ? enable 1- disable This is for debug purpose only.
22:19	0x0 RO	**RSVD0:** Reserved
18:0	0x0 RW	**RSVD2:** RESERVED **Power Well:** SUS

7.12.3 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

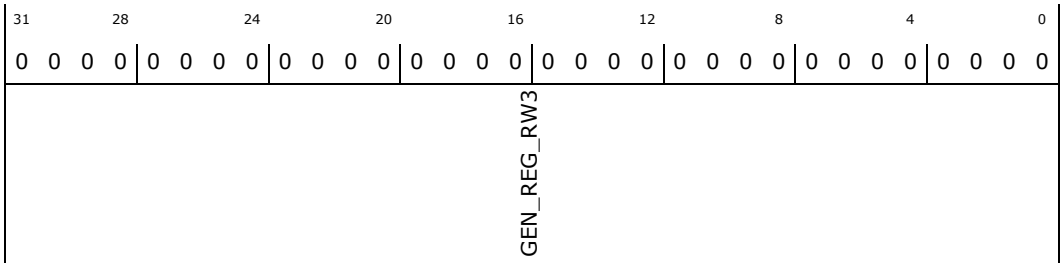
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**GEN_REG_RW3:** reserved

7.12.4 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

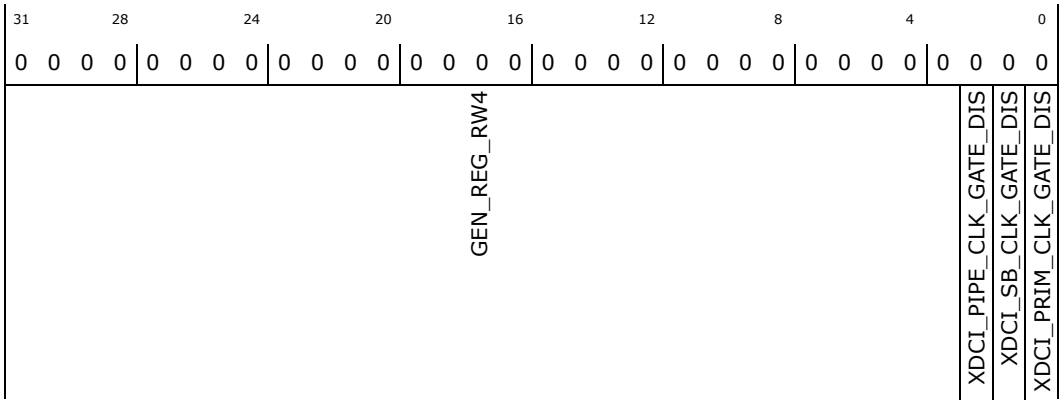
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**GEN_REG_RW4:** reserved
2	0x0 RW	**XDCI_PIPE_CLK_GATE_DIS:** xdci pipe clock gating disable
1	0x0 RW	**XDCI_SB_CLK_GATE_DIS:** xdci sideband clock gating disable
0	0x0 RW	**XDCI_PRIM_CLK_GATE_DIS:** xdci primary clock gating disable

7.12.5 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

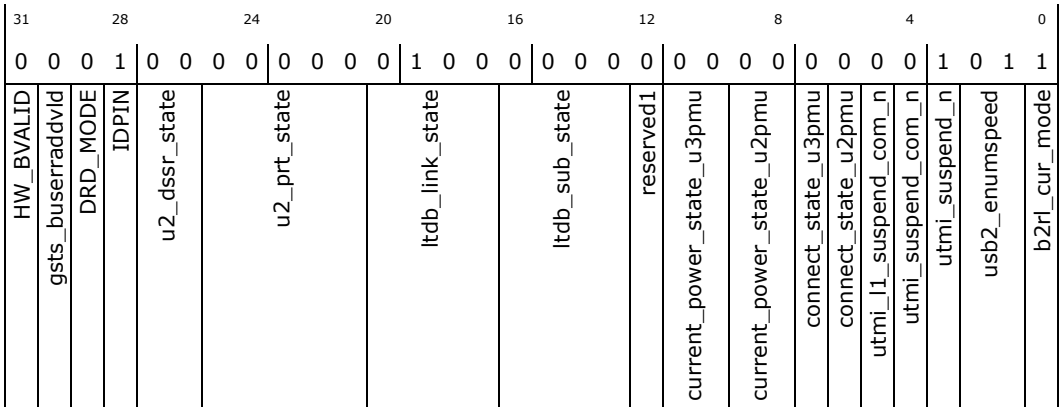
General Purpose Input Register

Access Method

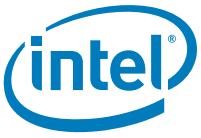
Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:22, F:0] + C0h

Default: 1008000Bh



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0x0 RO	**gsts_buserraddvld:** Bus error
29	0x0 RO	**DRD_MODE:** SS DRD mode 0 device mode 1 host mode
28	0x1 RO	**IDPIN:** IDPIN value (debounce)
27:26	0x0 RO	**u2_dssr_state:** USB2 DSSR State
25:21	0x0 RO	**u2_prt_state:** USB2 Port State
20:17	0x4 RO	**ltdb_link_state:** USB3 Link state
16:13	0x0 RO	**ltdb_sub_state:** USB3 Link sub state
12	0x0 RO	**reserved1:** Reserved.
11:10	0x0 RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	0x0 RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0x0 RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0x0 RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0x0 RO	**utmi_l1_suspend_com_n:** Common L1 suspend
4	0x0 RO	**utmi_suspend_com_n:** Common suspend
3	0x1 RO	**utmi_suspend_n:** USB 2.0 Port Suspend
2:1	0x1 RO	**usb2_enumspeed:** Device Enumerated Speed
0	0x1 RO	**b2rl_cur_mode:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device



7.13 USB2 PCI Configuration Registers

Table 49. Summary of PCI Configuration Registers—

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"PLLDIVRATIOS_0—Offset 0h" on page 3083	00640000h
C–Fh	4	"PLLSEQUENCE_1—Offset Ch" on page 3083	00080000h
10–13h	4	"CONFIG_0—Offset 10h" on page 3084	00000000h
14–17h	4	"CONFIG_1—Offset 14h" on page 3085	20000000h
18–1Bh	4	"CONFIG_2—Offset 18h" on page 3086	00000000h
1C–1Fh	4	"CONFIG_3—Offset 1Ch" on page 3086	00000000h
20–23h	4	"FILTER_OBS—Offset 20h" on page 3087	FFE00000h
24–27h	4	"VISA_OUT—Offset 24h" on page 3088	00000000h
28–2Bh	4	"DFT_0—Offset 28h" on page 3088	83FF3F00h
2C–2Fh	4	"DFT_1—Offset 2Ch" on page 3089	30000000h
34–37h	4	"DFT_3—Offset 34h" on page 3090	00022C0Ch
38–3Bh	4	"SFRCONFIG_0—Offset 38h" on page 3091	00880000h

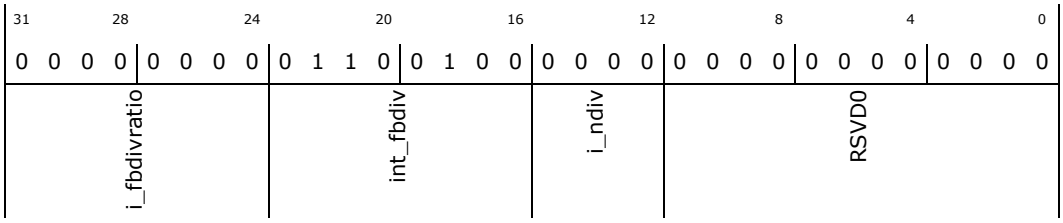
7.13.1 PLLDIVRATIOS_0—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 0h

Default: 00640000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	X RW/Strap	**i_fbdivratio [31:24] (i_fbdivratio):** generic 8bit feedback divider ratio. N=i_fbdivratio
23:16	0x64 RW	**int_fbdiv [23:16] (int_fbdiv):** For external fbclk usage, inserted the expected division ratio.
15:12	X RW/Strap	**i_ndiv [15:12] (i_ndiv):** Currently reserved bits. pre divider control. M=i_ndiv (only 1 to 7 are valid)
11:0	0x0 RO	**RSVD0:** Reserved

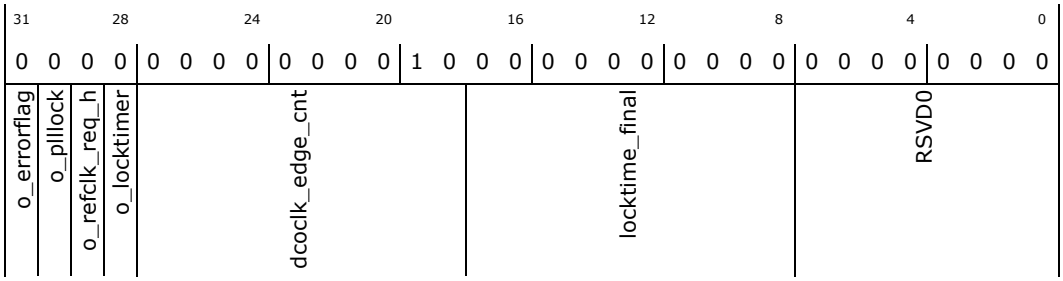
7.13.2 PLLSEQUENCE_1—Offset Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + Ch

Default: 00080000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**o_errorflag [31:31] (o_errorflag):** General Error flag.
30	0x0 RO	**o_plllock [30:30] (o_plllock):** PLL Lock indicator signal.

Bit Range	Default & Access	Field Name (ID): Description
29	0x0 RO	**o_refclk_req_h [29:29] (o_refclk_req_h):** ADPLL's Refclk request bit.
28	0x0 RO	**o_locktimer [28:28] (o_locktimer):** Lock time expected Indication bit.
27:18	0x2 RO	**dcoclk_edge_cnt [27:18] (dcoclk_edge_cnt):** DCO edge's counter
17:8	0x0 RO	**locktime_final [17:8] (locktime_final):** Locktime counter per refclk cycles, stops at overflow / lock.
7:0	0x0 RO	**RSVD0:** Reserved

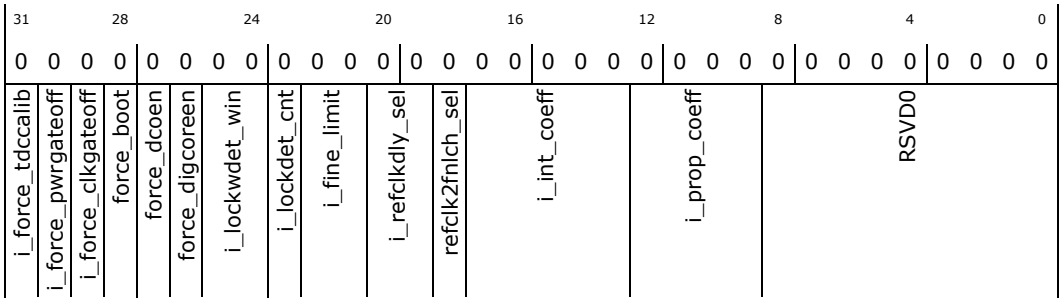
7.13.3 CONFIG_0—Offset 10h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	X RW/Strap	**i_force_tdccalib [31:31] (i_force_tdccalib):** force tdc calibration in c73usb250_normal locking
30	X RW/Strap	**i_force_pwrgateoff [30:30] (i_force_pwrgateoff):** force power gating off in all modes
29	X RW/Strap	**i_force_clkgateoff [29:29] (i_force_clkgateoff):** force clock gating off in all modes
28	0x0 RW	**force_boot [28:28] (force_boot):** EV: forces boot locking instead of c73usb250_normal locking
27	0x0 RW	**force_dcoen [27:27] (force_dcoen):** EV: forces dco enable even if PLL is off. Need this for example in openloop mode
26	0x0 RW	**force_digcoreen [26:26] (force_digcoreen):** EV: forces digital core reset off (unless pwrgood=0)
25:24	X RW/Strap	**i_lockwdet_win [25:24] (i_lockwdet_win):** phase error threshold at which PLL is unlocked (HH max pe allowed)

Bit Range	Default & Access	Field Name (ID): Description
23	X RW/Strap	**i_lockdet_cnt [23:23] (i_lockdet_cnt):** lock counter 32 (L) or 64 (H) cycles
22:21	X RW/Strap	**i_fine_limit [22:21] (i_fine_limit):** defines distance of fine code from edges that would trigger SFR trimming. Distance defined by 2^(fine_limit+5)
20:19	X RW/Strap	**i_refclkdly_sel [20:19] (i_refclkdly_sel):** control delay of refclk_dly clock that is used by DCO latches
18	0x0 RW	**refclk2fnlch_sel [18:18] (refclk2fnlch_sel):** Selects refproc's delayed clock / inverted version of refclk2dig for DCO latches n DS.
17:13	X RW/Strap	**i_int_coeff [17:13] (i_int_coeff):** Ki filter coefficient, 2^n. Two's complement
12:9	X RW/Strap	**i_prop_coeff [12:9] (i_prop_coeff):** Kp filter coefficient, 2^n. Two's complement
8:0	0x0 RO	**RSVD0:** Reserved

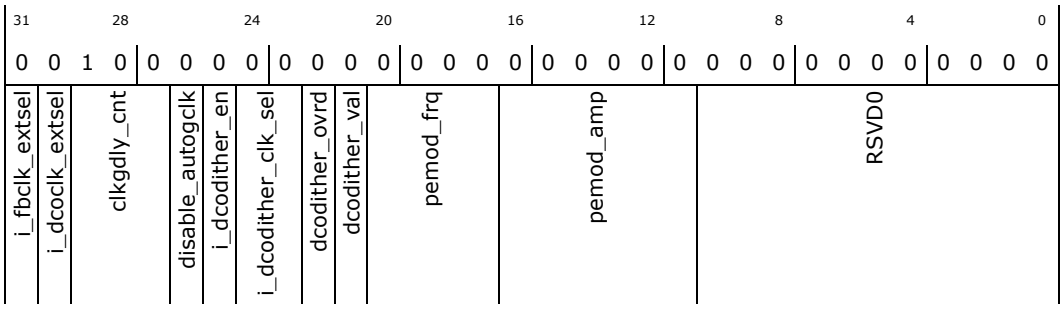
7.13.4 CONFIG_1—Offset 14h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 14h

Default: 20000000h



Bit Range	Default & Access	Field Name (ID): Description
31	X RW/Strap	**i_fbclk_extsel [31:31] (i_fbclk_extsel):** external feedback clock select (allowing use of external feedback divider). In this case, user must set fbdivratio to the feedback ratio he uses
30	X RW/Strap	**i_dcoclk_extsel [30:30] (i_dcoclk_extsel):** long loop clock select through dcoclk_ext clock
29:27	0x4 RW	**clkgdly_cnt [29:27] (clkgdly_cnt):** Delay for clock gating (0 menas no delay).
26	0x0 RW	**disable_autogclk [26:26] (disable_autogclk):** Disables auto-clockgating.
25	X RW/Strap	**i_dcodither_en [25:25] (i_dcodither_en):** enable sigma delta

Bit Range	Default & Access	Field Name (ID): Description
24:23	X RW/Strap	**i_dcodither_clk_sel [24:23] (i_dcodither_clk_sel):** select sigma delta over sampling clock
22	0x0 RW	**dcodither_ovrd [22:22] (dcodither_ovrd):** bypass sigma delta dithering bit with external bit
21	0x0 RW	**dcodither_val [21:21] (dcodither_val):** sigma delta dithering external bit
20:17	0x0 RW	**pemod_frq [20:17] (pemod_frq):** EV: pe modulation frequency
16:11	0x0 RW	**pemod_amp [16:11] (pemod_amp):** EV: pe modulation amplitude. Two's complement
10:0	0x0 RO	**RSVD0:** Reserved

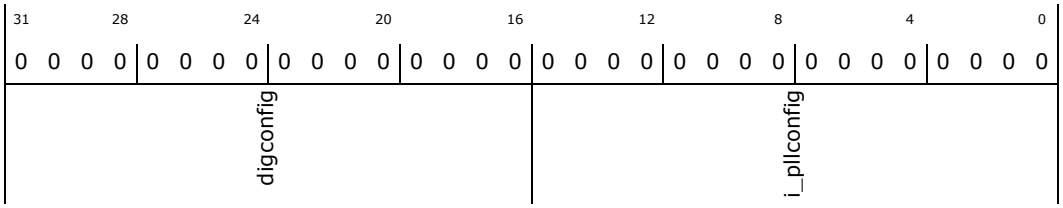
7.13.5 CONFIG_2—Offset 18h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**digconfig [31:16] (digconfig):** Digital's internal spare config.
15:0	X RW/Strap	**i_pllconfig [15:0] (i_pllconfig):** general configuration bits: quick_phase, coarse_sweepen, tdc_sweepen, use_refclkdel2dcolat

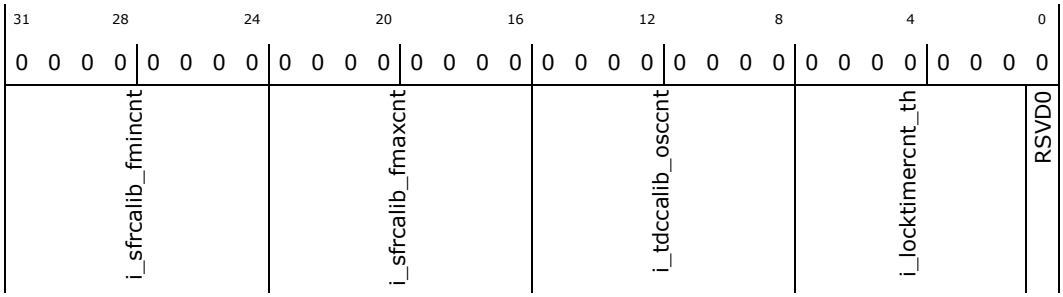
7.13.6 CONFIG_3—Offset 1Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 1Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	X RW/Strap	**i_sfrcalib_fmincnt [31:24] (i_sfrcalib_fmincnt):** set to round(1.1GHz/ Fref)-1 for proper SFR calibration
23:16	X RW/Strap	**i_sfrcalib_fmaxcnt [23:16] (i_sfrcalib_fmaxcnt):** set to round(3.43GHz/Fref)-1 for proper SFR calibration
15:8	X RW/Strap	**i_tdccalib_osccnt [15:8] (i_tdccalib_osccnt):** set to round(1.47GHz/ Frefclk)-1 for proper TDC calibration
7:1	X RW/Strap	**i_locktimercnt_th [7:1] (i_locktimercnt_th):** Set this bus to the number of refclk cycles after which the o_locktimer is asserted,
0	0x0 RO	**RSVD0:** Reserved

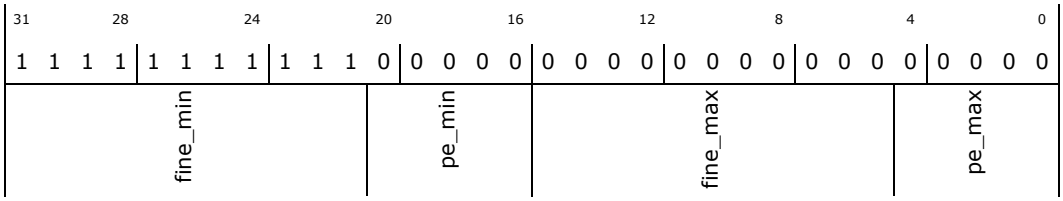
7.13.7 FILTER_OBS—Offset 20h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 20h

Default: FFE00000h



Bit Range	Default & Access	Field Name (ID): Description
31:21	0x7ff RO	**fine_min [31:21] (fine_min):** DCO's fine code min sampled value.
20:16	0x0 RO	**pe_min [20:16] (pe_min):** Phase error min sampled value.
15:5	0x0 RO	**fine_max [15:5] (fine_max):** DCO's fine code max sampled value.
4:0	0x0 RO	**pe_max [4:0] (pe_max):** Phase error max sampled value.

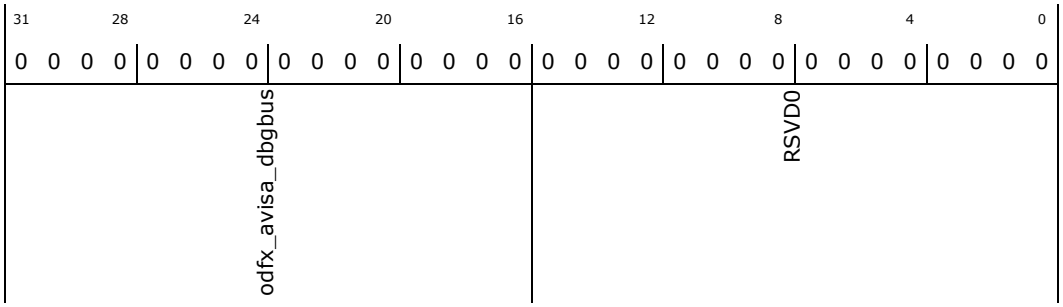
7.13.8 VISA_OUT—Offset 24h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 24h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**odfx_avisa_dbgbus [31:16] (odfx_avisa_dbgbus):** Visa lane's 1 n 0
15:0	0x0 RO	**RSVD0:** Reserved

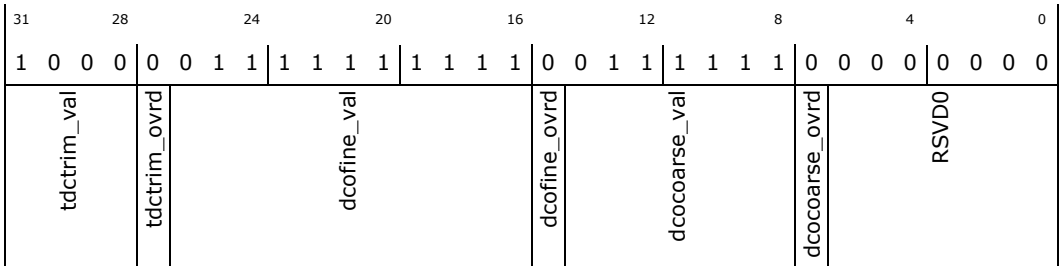
7.13.9 DFT_0—Offset 28h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 28h

Default: 83FF3F00h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x8 RW	**tdctrim_val [31:28] (tdctrim_val):** TDC trim override value
27	0x0 RW	**tdctrim_ovrd [27:27] (tdctrim_ovrd):** TDC trim override select
26:16	0x3ff RW	**dcofine_val [26:16] (dcofine_val):** EV: DCO fine override value

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**dcofine_ovrd [15:15] (dcofine_ovrd):** EV: DCO fine override select
14:8	0x3f RW	**dcocoarse_val [14:8] (dcocoarse_val):** EV: DCO coarse override value
7	0x0 RW	**dcocoarse_ovrd [7:7] (dcocoarse_ovrd):** EV: bypass coarse calibration code with coarse_val
6:0	0x0 RO	**RSVD0:** Reserved

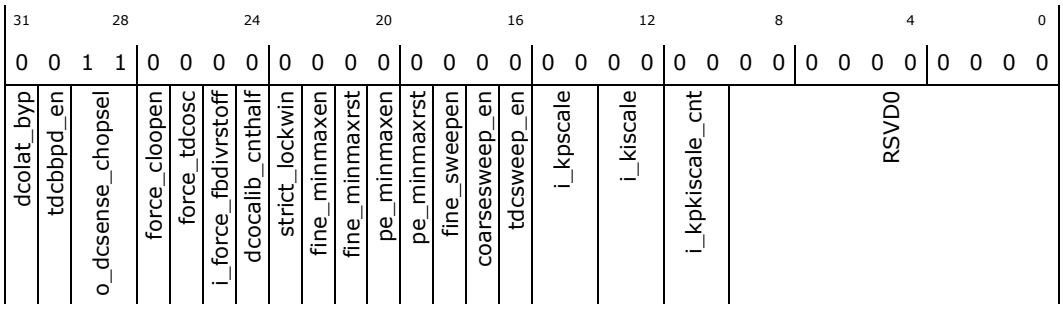
7.13.10 DFT_1—Offset 2Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 2Ch

Default: 30000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**dcolat_byp [31:31] (dcolat_byp):** Makes DCO latches transparent. Allows open loop checks without refclk.
30	0x0 RW	**tdcbbpd_en [30:30] (tdcbbpd_en):** Enable bbpd in the sign bit of the TDC instead of FFPD
29:28	0x3 RW	**o_dcsense_chopsel [29:28] (o_dcsense_chopsel):** div_farm clock chooper: '00' = refclk. '01', '11' = vss, '10' = vcc
27	0x0 RW	**force_cloopen [27:27] (force_cloopen):** EV: forces PLL into close loop mode and final filter coefficient
26	0x0 RW	**force_tdcosc [26:26] (force_tdcosc):** EV: configures TDC chain as ring oscillator
25	X RW/Strap	**i_force_fbdivrstoff [25:25] (i_force_fbdivrstoff):** force feedback divider reset off in all modes
24	0x0 RW	**dcocalib_cnthalf [24:24] (dcocalib_cnthalf):** dco calibration (and tdc calibration?) counter counts half of default count for faster calibration
23	0x0 RW	**strict_lockwin [23:23] (strict_lockwin):** Strict Lock window config. '0' = -1(pe_tdc(0 for 8 cycles. '1' = -2(pe_tdc(1 for 16 cycles.

Bit Range	Default & Access	Field Name (ID): Description
22	0x0 RW	**fine_minmaxen [22:22] (fine_minmaxen):** when '1', min/max values of fine code are monitored (anyway, not when lock=0)
21	0x0 RW	**fine_minmaxrst [21:21] (fine_minmaxrst):** resets the fine minmax value
20	0x0 RW	**pe_minmaxen [20:20] (pe_minmaxen):** when '1', min/max values of TDC output code are monitored (anyway, not when lock=0)
19	0x0 RW	**pe_minmaxrst [19:19] (pe_minmaxrst):** resets the pe_minmax value
18	0x0 RW	**fine_sweepen [18:18] (fine_sweepen):** EV: sweep fine code (triangle sweep)
17	0x0 RW	**coarsesweep_en [17:17] (coarsesweep_en):** Coarse sweep bit.
16	0x0 RW	**tdcsweep_en [16:16] (tdcsweep_en):** TDC sweep bit.
15:14	X RW/Strap	**i_kpscale [15:14] (i_kpscale):** Kp scaling during startup for faster lock (2^n)
13:12	X RW/Strap	**i_kiscale [13:12] (i_kiscale):** Ki scaling during startup for faster lock (2^n)
11:10	X RW/Strap	**i_kpkiscale_cnt [11:10] (i_kpkiscale_cnt):** controls number of refclk cycles at startup at which Kp and Ki are scaled up for faster lock (kpscale, kiscale)
9:0	0x0 RO	**RSVD0:** Reserved

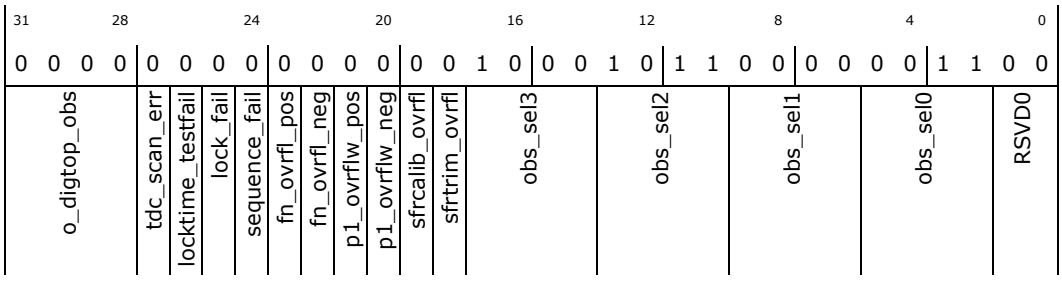
7.13.11 DFT_3—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 34h

Default: 00022C0Ch



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**o_digtop_obs [31:28] (o_digtop_obs):** Digital Obs out.

Bit Range	Default & Access	Field Name (ID): Description
27	0x0 RO	**tdc_scan_err [27:27] (tdc_scan_err):** TDC scan test error flag.
26	0x0 RO	**locktime_testfail [26:26] (locktime_testfail):** Narrow lock window test failed
25	0x0 RO	**lock_fail [25:25] (lock_fail):** PLL went out of lock.
24	0x0 RO	**sequence_fail [24:24] (sequence_fail):** Calib procedure fail flag.
23	0x0 RO	**fn_ovrfl_pos [23:23] (fn_ovrfl_pos):** Fine Positive code overflow.
22	0x0 RO	**fn_ovrfl_neg [22:22] (fn_ovrfl_neg):** Fine Negative code overflow.
21	0x0 RO	**p1_ovrflw_pos [21:21] (p1_ovrflw_pos):** Filter's Integrator Positive code overflow.
20	0x0 RO	**p1_ovrflw_neg [20:20] (p1_ovrflw_neg):** Filter's Integrator Negative code overflow.
19	0x0 RO	**sfrcalib_ovrfl [19:19] (sfrcalib_ovrfl):** SFR calib overflow.
18	0x0 RO	**sfrtrim_ovrfl [18:18] (sfrtrim_ovrfl):** SFR trim overflow.
17:14	0x8 RW	**obs_sel3 [17:14] (obs_sel3):** obs(3) muxing control bits.
13:10	0xb RW	**obs_sel2 [13:10] (obs_sel2):** obs(2) muxing control bits.
9:6	0x0 RW	**obs_sel1 [9:6] (obs_sel1):** obs(1) muxing control bits.
5:2	0x3 RW	**obs_sel0 [5:2] (obs_sel0):** obs(0) muxing control bits.
1:0	0x0 RO	**RSVD0:** Reserved

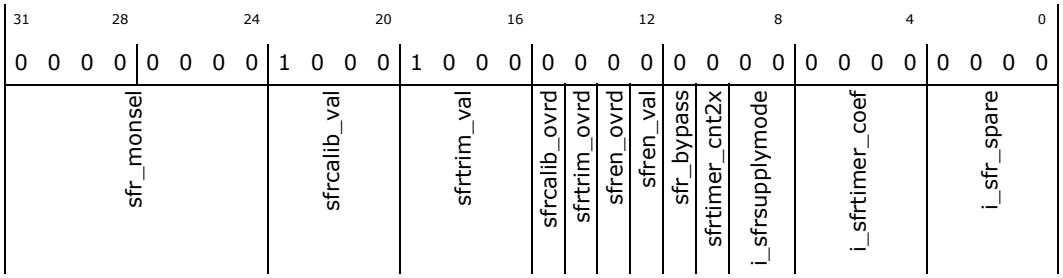
7.13.12 SFRCONFIG_0—Offset 38h

Access Method

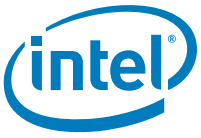
Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:, D:, F:] + 38h

Default: 00880000h



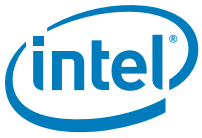
Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**sfr_monsel [31:24] (sfr_monsel):** Select for SFR analog monitor
23:20	0x8 RW	**sfrcalib_val [23:20] (sfrcalib_val):** sfr calibration initial value. Also used as override value when calib_ovrd is 1
19:16	0x8 RW	**sfrtrim_val [19:16] (sfrtrim_val):** EV: sfr trim override value
15	0x0 RW	**sfrcalib_ovrd [15:15] (sfrcalib_ovrd):** EV: sfr calibration is bypassed with sfrcalib_val
14	0x0 RW	**sfrtrim_ovrd [14:14] (sfrtrim_ovrd):** EV: sfr trim override select
13	0x0 RW	**sfren_ovrd [13:13] (sfren_ovrd):** EV: SFR enable override (bypass the power up sequence)
12	0x0 RW	**sfren_val [12:12] (sfren_val):** EV: SFR enable value
11	0x0 RW	**sfr_bypass [11:11] (sfr_bypass):** EV: SFR bypass control
10	0x0 RW	**sfrtimer_cnt2x [10:10] (sfrtimer_cnt2x):** EV: multiplies SFR counters by 2x
9:8	X RW/Strap	**i_sfrsupplymode [9:8] (i_sfrsupplymode):** SFR supply indicator. 01 for 1.35v and 00 for 1.25v
7:4	X RW/Strap	**i_sfrtimer_coef [7:4] (i_sfrtimer_coef):** set this bus to round((Frefclk / 20MHz) - 1) to allow ADPLL generate an absolute timer for SFR trimming, SFR calibration, SFR on and DCO settle
3:0	X RW/Strap	**i_sfr_spare [3:0] (i_sfr_spare):** SFR spare config registers



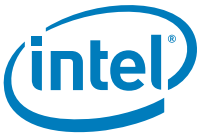
7.14 USB2.0 I/O Configuration Registers

Table 50. Summary of Message Bus Registers—

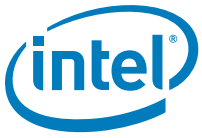
Offset	Register Name (Register Symbol)	Default Value
4100–4103h	"USB2 PER PORT (USB2_PER_PORT_PP0)—Offset 4100h" on page 3101	00055A01h
4200–4203h	"USB2 PER PORT (USB2_PER_PORT_PP1)—Offset 4200h" on page 3104	00055A01h
4300–4303h	"USB2 PER PORT (USB2_PER_PORT_PP2)—Offset 4300h" on page 3108	00055A01h
4400–4403h	"USB2 PER PORT (USB2_PER_PORT_PP3)—Offset 4400h" on page 3111	00055A01h
4500–4503h	"USB2 PER PORT (USB2_PER_PORT_PP4)—Offset 4500h" on page 3115	00055A01h
4001–4004h	"USB2 GLOBAL PORT (USB2_GLOBAL_PORT)—Offset 4001h" on page 3118	0C3D8006h
7F02–7F02h	"USB2 PLL1 (USB2_PLL1)—Offset 7F02h" on page 3122	0E802470h
7F03–7F03h	"USB2 PLL2 (USB2_PLL2)—Offset 7F03h" on page 3124	03000B00h
7F04–7F07h	"USB2 COMPBG (USB2_COMPBG)—Offset 7F04h" on page 3126	00000600h
4105–4105h	"UTMI RX REG1 PER PORT (UTMI_RX_REG1_PER_PORT_PP0)—Offset 4105h" on page 3129	00000000h
4106–4106h	"UTMI RX REG2 PER PORT (UTMI_RX_REG2_PER_PORT_PP0)—Offset 4106h" on page 3129	00000000h
4107–4107h	"UTMI TX REG PER PORT (UTMI_TX_REG_PER_PORT_PP0)—Offset 4107h" on page 3130	00000000h
4108–410Bh	"UTMI MISC REG PER PORT (UTMI_MISC_REG_PER_PORT_PP0)—Offset 4108h" on page 3131	00000050h
4205–4205h	"UTMI RX REG1 PER PORT (UTMI_RX_REG1_PER_PORT_PP1)—Offset 4205h" on page 3133	00000000h
4206–4206h	"UTMI RX REG2 PER PORT (UTMI_RX_REG2_PER_PORT_PP1)—Offset 4206h" on page 3134	00000000h
4207–4207h	"UTMI TX REG PER PORT (UTMI_TX_REG_PER_PORT_PP1)—Offset 4207h" on page 3134	00000000h
4208–420Bh	"UTMI MISC REG PER PORT (UTMI_MISC_REG_PER_PORT_PP1)—Offset 4208h" on page 3135	00000050h
4305–4305h	"UTMI RX REG1 PER PORT (UTMI_RX_REG1_PER_PORT_PP2)—Offset 4305h" on page 3138	00000000h
4306–4306h	"UTMI RX REG2 PER PORT (UTMI_RX_REG2_PER_PORT_PP2)—Offset 4306h" on page 3138	00000000h
4307–4307h	"UTMI TX REG PER PORT (UTMI_TX_REG_PER_PORT_PP2)—Offset 4307h" on page 3138	00000000h



Offset	Register Name (Register Symbol)	Default Value
4308–430Bh	"UTMI MISC REG PER PORT (UTMI_MISC_REG_PER_PORT_PP2)—Offset 4308h" on page 3140	00000050h
4405–4405h	"UTMI RX REG1 PER PORT (UTMI_RX_REG1_PER_PORT_PP3)—Offset 4405h" on page 3142	00000000h
4406–4406h	"UTMI RX REG2 PER PORT (UTMI_RX_REG2_PER_PORT_PP3)—Offset 4406h" on page 3142	00000000h
4407–4407h	"UTMI TX REG PER PORT (UTMI_TX_REG_PER_PORT_PP3)—Offset 4407h" on page 3143	00000000h
4408–440Bh	"UTMI MISC REG PER PORT (UTMI_MISC_REG_PER_PORT_PP3)—Offset 4408h" on page 3144	00000050h
4505–4505h	"UTMI RX REG1 PER PORT (UTMI_RX_REG1_PER_PORT_PP4)—Offset 4505h" on page 3147	00000000h
4506–4506h	"UTMI RX REG2 PER PORT (UTMI_RX_REG2_PER_PORT_PP4)—Offset 4506h" on page 3147	00000000h
4507–4507h	"UTMI TX REG PER PORT (UTMI_TX_REG_PER_PORT_PP4)—Offset 4507h" on page 3147	00000000h
4508–450Bh	"UTMI MISC REG PER PORT (UTMI_MISC_REG_PER_PORT_PP4)—Offset 4508h" on page 3149	00000050h
7F09–7F09h	"RCOMP REGISTER (RCOMP_REGISTER)—Offset 7F09h" on page 3151	81A2040Fh
7F0A–7F0Dh	"ICOMP REGISTER (ICOMP_REGISTER)—Offset 7F0Ah" on page 3152	00008001h
400B–400Bh	"USB2 TEST GLOBAL REG1 (USB2_TEST_GLOBAL_REG1)—Offset 400Bh" on page 3154	00000000h
400C–400Ch	"USB2 TEST GLOBAL REG2 (USB2_TEST_GLOBAL_REG2)—Offset 400Ch" on page 3156	00007FF8h
400D–400Dh	"USB2 TEST GLOBAL REG3 (USB2_TEST_GLOBAL_REG3)—Offset 400Dh" on page 3156	00000000h
400E–400Fh	"USB2 TEST GLOBAL REG4 (USB2_TEST_GLOBAL_REG4)—Offset 400Eh" on page 3157	00000000h
410F–4112h	"ICOMP PERPORT REG (ICOMP_PERPORT_REG_PP0)—Offset 410Fh" on page 3157	00000000h
420F–4212h	"ICOMP PERPORT REG (ICOMP_PERPORT_REG_PP1)—Offset 420Fh" on page 3158	00000000h
430F–4312h	"ICOMP PERPORT REG (ICOMP_PERPORT_REG_PP2)—Offset 430Fh" on page 3158	00000000h
440F–4412h	"ICOMP PERPORT REG (ICOMP_PERPORT_REG_PP3)—Offset 440Fh" on page 3159	00000000h
450F–4512h	"ICOMP PERPORT REG (ICOMP_PERPORT_REG_PP4)—Offset 450Fh" on page 3159	00000000h
4010–4010h	"USB2 TEST GLOBAL REG5 (USB2_TEST_GLOBAL_REG5)—Offset 4010h" on page 3160	00FE00C7h
4011–4011h	"USB2 TEST GLOBAL REG6 (USB2_TEST_GLOBAL_REG6)—Offset 4011h" on page 3161	0003C07Fh

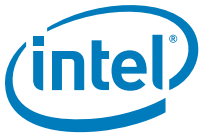


Offset	Register Name (Register Symbol)	Default Value
4012–4015h	"USB2 TEST GLOBAL REG7 (USB2_TEST_GLOBAL_REG7)—Offset 4012h" on page 3163	00000000h
4113–4114h	"USB2 TEST PERPORT REG1 (USB2_TEST_PERPORT_REG1_PP0)—Offset 4113h" on page 3164	00000000h
4213–4214h	"USB2 TEST PERPORT REG1 (USB2_TEST_PERPORT_REG1_PP1)—Offset 4213h" on page 3166	00000000h
4313–4314h	"USB2 TEST PERPORT REG1 (USB2_TEST_PERPORT_REG1_PP2)—Offset 4313h" on page 3168	00000000h
4413–4414h	"USB2 TEST PERPORT REG1 (USB2_TEST_PERPORT_REG1_PP3)—Offset 4413h" on page 3170	00000000h
4513–4514h	"USB2 TEST PERPORT REG1 (USB2_TEST_PERPORT_REG1_PP4)—Offset 4513h" on page 3173	00000000h
7F14–7F17h	"USB2 COMPBG2 (USB2_COMPBG2)—Offset 7F14h" on page 3175	00000080h
4115–4115h	"USB2 VISA PERPORT REG1 (USB2_VISA_PERPORT_REG1_PP0)—Offset 4115h" on page 3176	00000000h
4116–4116h	"USB2 VISA PERPORT REG2 (USB2_VISA_PERPORT_REG2_PP0)—Offset 4116h" on page 3177	00000000h
4117–411Ah	"USB2 VISA PERPORT REG3 (USB2_VISA_PERPORT_REG3_PP0)—Offset 4117h" on page 3178	00000000h
4215–4215h	"USB2 VISA PERPORT REG1 (USB2_VISA_PERPORT_REG1_PP1)—Offset 4215h" on page 3179	00000000h
4216–4216h	"USB2 VISA PERPORT REG2 (USB2_VISA_PERPORT_REG2_PP1)—Offset 4216h" on page 3180	00000000h
4217–421Ah	"USB2 VISA PERPORT REG3 (USB2_VISA_PERPORT_REG3_PP1)—Offset 4217h" on page 3181	00000000h
4315–4315h	"USB2 VISA PERPORT REG1 (USB2_VISA_PERPORT_REG1_PP2)—Offset 4315h" on page 3182	00000000h
4316–4316h	"USB2 VISA PERPORT REG2 (USB2_VISA_PERPORT_REG2_PP2)—Offset 4316h" on page 3183	00000000h
4317–431Ah	"USB2 VISA PERPORT REG3 (USB2_VISA_PERPORT_REG3_PP2)—Offset 4317h" on page 3184	00000000h
4415–4415h	"USB2 VISA PERPORT REG1 (USB2_VISA_PERPORT_REG1_PP3)—Offset 4415h" on page 3185	00000000h
4416–4416h	"USB2 VISA PERPORT REG2 (USB2_VISA_PERPORT_REG2_PP3)—Offset 4416h" on page 3186	00000000h
4417–441Ah	"USB2 VISA PERPORT REG3 (USB2_VISA_PERPORT_REG3_PP3)—Offset 4417h" on page 3187	00000000h
4515–4515h	"USB2 VISA PERPORT REG1 (USB2_VISA_PERPORT_REG1_PP4)—Offset 4515h" on page 3188	00000000h
4516–4516h	"USB2 VISA PERPORT REG2 (USB2_VISA_PERPORT_REG2_PP4)—Offset 4516h" on page 3189	00000000h
4517–451Ah	"USB2 VISA PERPORT REG3 (USB2_VISA_PERPORT_REG3_PP4)—Offset 4517h" on page 3190	00000000h



Offset	Register Name (Register Symbol)	Default Value
4018–4018h	"USB2 VISA GLOBAL REG1 (USB2_VISA_GLOBAL_REG1)—Offset 4018h" on page 3191	00000000h
4019–4019h	"USB2 VISA GLOBAL REG2 (USB2_VISA_GLOBAL_REG2)—Offset 4019h" on page 3192	00000000h
401A–401Dh	"USB2 VISA GLOBAL REG3 (USB2_VISA_GLOBAL_REG3)—Offset 401Ah" on page 3192	00000000h
411B–411Bh	"USB2 SQ DPDM OFFSET PERPORT REG (USB2_SQ_DPDM_OFFSET_PERPORT_REG_PP0)—Offset 411Bh" on page 3193	20404080h
411C–411Ch	"USB2 SQ DMDP OFFSET PERPORT REG (USB2_SQ_DMDP_OFFSET_PERPORT_REG_PP0)—Offset 411Ch" on page 3195	20404080h
411D–4120h	"USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP0)—Offset 411Dh" on page 3197	20408100h
421B–421Bh	"USB2 SQ DPDM OFFSET PERPORT REG (USB2_SQ_DPDM_OFFSET_PERPORT_REG_PP1)—Offset 421Bh" on page 3199	20404080h
421C–421Ch	"USB2 SQ DMDP OFFSET PERPORT REG (USB2_SQ_DMDP_OFFSET_PERPORT_REG_PP1)—Offset 421Ch" on page 3202	20404080h
421D–4220h	"USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP1)—Offset 421Dh" on page 3204	20408100h
431B–431Bh	"USB2 SQ DPDM OFFSET PERPORT REG (USB2_SQ_DPDM_OFFSET_PERPORT_REG_PP2)—Offset 431Bh" on page 3206	20404080h
431C–431Ch	"USB2 SQ DMDP OFFSET PERPORT REG (USB2_SQ_DMDP_OFFSET_PERPORT_REG_PP2)—Offset 431Ch" on page 3208	20404080h
431D–4320h	"USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP2)—Offset 431Dh" on page 3210	20408100h
441B–441Bh	"USB2 SQ DPDM OFFSET PERPORT REG (USB2_SQ_DPDM_OFFSET_PERPORT_REG_PP3)—Offset 441Bh" on page 3212	20404080h
441C–441Ch	"USB2 SQ DMDP OFFSET PERPORT REG (USB2_SQ_DMDP_OFFSET_PERPORT_REG_PP3)—Offset 441Ch" on page 3215	20404080h
441D–4420h	"USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP3)—Offset 441Dh" on page 3217	20408100h
451B–451Bh	"USB2 SQ DPDM OFFSET PERPORT REG (USB2_SQ_DPDM_OFFSET_PERPORT_REG_PP4)—Offset 451Bh" on page 3219	20404080h
451C–451Ch	"USB2 SQ DMDP OFFSET PERPORT REG (USB2_SQ_DMDP_OFFSET_PERPORT_REG_PP4)—Offset 451Ch" on page 3221	20404080h
451D–4520h	"USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP4)—Offset 451Dh" on page 3223	20408100h
7F1E–7F20h	"USB2 SQDIS OFFSET GLOBAL REG (USB2_SQDIS_OFFSET_GLOBAL_REG)—Offset 7F1Eh" on page 3225	00000015h
401F–401Fh	"USB2 DEVICE MODE GLOBAL REG (USB2_DEVICE_MODE_GLOBAL_REG)—Offset 401Fh" on page 3226	00000018h
4020–4023h	"USB2 TEST GLOBAL SERIAL LOOPBACK (USB2_TEST_GLOBAL_SERIAL_LOOPBACK)—Offset 4020h" on page 3228	00000000h
7F21–7F24h	"USB2 GLOBAL COMP CMP OFFSET REG (USB2_GLOBAL_COMP_CMP_OFFSET_REG)—Offset 7F21h" on page 3229	20408100h

Offset	Register Name (Register Symbol)	Default Value
4122–4122h	"PER PORT RCOMP HS PULLUP REGISTER (PER_PORT_RCOMP_HS_PULLUP_REGISTER_PP0)—Offset 4122h" on page 3231	00004011h
4123–4125h	"PER PORT RCOMP HS PULLDOWN REGISTER (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_PP0)—Offset 4123h" on page 3232	00004011h
4222–4222h	"PER PORT RCOMP HS PULLUP REGISTER (PER_PORT_RCOMP_HS_PULLUP_REGISTER_PP1)—Offset 4222h" on page 3234	00004011h
4223–4225h	"PER PORT RCOMP HS PULLDOWN REGISTER (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_PP1)—Offset 4223h" on page 3235	00004011h
4322–4322h	"PER PORT RCOMP HS PULLUP REGISTER (PER_PORT_RCOMP_HS_PULLUP_REGISTER_PP2)—Offset 4322h" on page 3237	00004011h
4323–4325h	"PER PORT RCOMP HS PULLDOWN REGISTER (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_PP2)—Offset 4323h" on page 3238	00004011h
4422–4422h	"PER PORT RCOMP HS PULLUP REGISTER (PER_PORT_RCOMP_HS_PULLUP_REGISTER_PP3)—Offset 4422h" on page 3240	00004011h
4423–4425h	"PER PORT RCOMP HS PULLDOWN REGISTER (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_PP3)—Offset 4423h" on page 3241	00004011h
4522–4522h	"PER PORT RCOMP HS PULLUP REGISTER (PER_PORT_RCOMP_HS_PULLUP_REGISTER_PP4)—Offset 4522h" on page 3243	00004011h
4523–4525h	"PER PORT RCOMP HS PULLDOWN REGISTER (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_PP4)—Offset 4523h" on page 3244	00004011h
4024–4024h	"GLOBAL RCOMP CL 45OHM 15K PULLDOWN REGISTER (GLOBAL_RCOMP_CL_45OHM_15K_PULLDOWN_REGISTER)—Offset 4024h" on page 3246	00007F11h
4025–4028h	"GLOBAL RCOMP CL 1POINT5K PULL-UP REGISTER (GLOBAL_RCOMP_CL_1POINT5K_PULLUP_REGISTER)—Offset 4025h" on page 3247	00004011h
4126–4127h	"USB2 PER PORT 2 (USB2_PER_PORT_2_PP0)—Offset 4126h" on page 3249	00829248h
4226–4227h	"USB2 PER PORT 2 (USB2_PER_PORT_2_PP1)—Offset 4226h" on page 3252	00829248h
4326–4327h	"USB2 PER PORT 2 (USB2_PER_PORT_2_PP2)—Offset 4326h" on page 3254	00829248h
4426–4427h	"USB2 PER PORT 2 (USB2_PER_PORT_2_PP3)—Offset 4426h" on page 3257	00829248h
4526–4527h	"USB2 PER PORT 2 (USB2_PER_PORT_2_PP4)—Offset 4526h" on page 3260	00829248h
7F27–7F2Ah	"USB2 PLL3 (USB2_PLL3)—Offset 7F27h" on page 3262	D0413866h
4128–412Bh	"PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP0)—Offset 4128h" on page 3264	00000000h
4228–422Bh	"PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP1)—Offset 4228h" on page 3265	00000000h
4328–432Bh	"PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP2)—Offset 4328h" on page 3267	00000000h



Offset	Register Name (Register Symbol)	Default Value
4428–442Bh	"PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP3)—Offset 4428h" on page 3269	00000000h
4528–452Bh	"PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP4)—Offset 4528h" on page 3270	00000000h
4029–4029h	"GLB ADP OFFSET REG (GLB_ADP_OFFSET_REG)—Offset 4029h" on page 3272	20408100h
402A–402Ah	"GLB VBUS OFFSET REG (GLB_VBUS_OFFSET_REG)—Offset 402Ah" on page 3274	20408100h
402B–402Bh	"GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG)—Offset 402Bh" on page 3276	002A4005h
402C–402Ch	"USB2 GLOBAL PORT 2 (USB2_GLOBAL_PORT_2)—Offset 402Ch" on page 3278	00625000h
402D–402Dh	"GLB CLOCK PORT 0/1 REPEATER (GLB_CLOCK_PORT_0_1_REPEATER)—Offset 402Dh" on page 3281	00000000h
402E–402Eh	"GLB CLOCK PORT 2/3 REPEATER (GLB_CLOCK_PORT_2_3_REPEATER)—Offset 402Eh" on page 3282	00000000h
402F–402Fh	"GLB CLOCK PORT 4/5 REPEATER (GLB_CLOCK_PORT_4_5_REPEATER)—Offset 402Fh" on page 3282	00000000h

7.14.1 USB2 PER PORT (USB2_PER_PORT_PP0)—Offset 4100h

Access Method

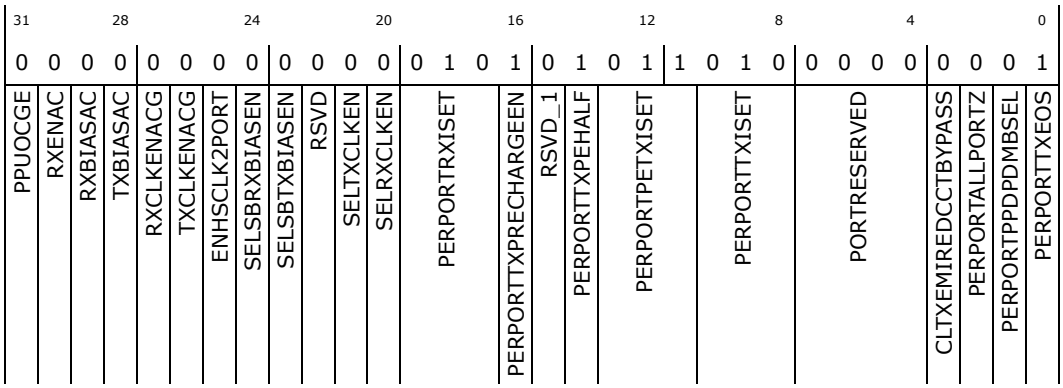
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4100h

Op Codes:

h - Read, h - Write

Default: 00055A01h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Per-Port UTMI_CLK Output Clock Gating Enable (PPUOCGE):** 1: Dynamic Clock Gating is enabled based on L1/L2 suspend indicator. This is the recommended setting for SYNOPSYS based controllers. 0: Output UTMI_CLK is running unless USB PLL is shutdown. This is the recommended setting for FRESCO based controllers. **Power Well:** SUS
30	0x0 RW	**RX EN AFE Control (RXENAC):** 1: Enables the dynamic RX EN behavior. This allows compensation code updates at various boundaries. 0: Disables the dynamic RX EN behavior (function of TXVALID only). RXENAC, RXBIASAC: 00: Legacy mode 01: Illegal 10: Allows additional code update window 11: Allows additional code update window with power saving **Power Well:** SUS
29	0x0 RW	**RX BIAS AFE Control (RXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal RXBIAS policy is selected (SELSBRXBIASEN = 0b). **Power Well:** SUS
28	0x0 RW	**TX BIAS AFE Control (TXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal TXBIAS policy is selected (SELSBTXBIASEN = 0b). **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
27	0x0 RW	**RX CLKEN AFE Clock Gating (RXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal RXCLKEN policy is selected (SELRXCLKEN = 0b). **Power Well:** SUS
26	0x0 RW	**TX CLKEN AFE Clock Gating (TXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal TXCLKEN policy is selected (SELTXCLKEN = 0b). **Power Well:** SUS
25	0x0 RW	**ENHSCLK2PORT:** This per-port pin will generate HS clock data pattern for testing purposes for that port and ignore the core data during Tx: 1: The port will transmit 10101..clock data pattern when txen=1. 0: The port will resume to c73usb250_normal operation where data is generated by the controller. **Power Well:** SUS
24	0x0 RW	**SELSBRXBIASEN:** This is to select between the UTMI internal vs. side-band control over the AFE RX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP. **Power Well:** SUS
23	0x0 RW	**SELSBTXBIASEN:** This is to select between the UTMI internal vs. side-band control over the AFE TX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP. **Power Well:** SUS
22	0x0 WO	**RSVD:** RSVD (RSVD): FORCEPPICOMP (FORCEPPICOMP): Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Testmode When set to 1b, this will force per-port icomp offset cancellation Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. This is a pulse trigger event. **Power Well:** SUS
21	0x0 RW	**SELTXCLKEN:** This is to select between internal mode vs. side-band control on the TX clock enable signal. 0 - override for TXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller. **Power Well:** SUS
20	0x0 RW	**SELRXCLKEN:** This is to select between internal mode vs. side-band control on the RX clock enable signal. 0 - override for RXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
19:17	0x2 RW	**PerPort HS Receiver Bias (PERPORTRXISET):** Config bit (per port) HS Receiver Bias current offset bit (2:0) 000 - 80uA 001 - 90uA 010 (default) - 100uA 011 - 110uA 100 - 120uA 101 - 130uA 110 - 140uA 111 - 150uA **Power Well:** SUS
16	0x1 RW	**PerPort Common Mode Pre-charge (PERPORTTXPRECHARGEEN):** Config bit (per port) To select whether to enable or disable the common mode pre-charge during SOP and EOP. Pre-charge hold for 4 cycles before first data transmission. This is to allow common choke ring back to settle down before driving first data bit to meet eye opening spec. 1 - pre-charge ON 0 - pre-charge OFF **Power Well:** SUS
15	0x0 RW	**RSVD (RSVD_1):** Reserved. **Power Well:** SUS
14	0x1 RW	**PerPort Half Bit Pre-emphasis (PERPORTTXPEHALF):** Config bit (per port) to select between half-bit or full-bit implementation 1 - select half-bit pre-emphasis 0 - select full-bit pre-emphasis. **Power Well:** SUS
13:11	0x3 RW	**PerPort HS Pre-emphasis Bias (PERPORTPETXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit (2:0) Value Preempen: deempen = 01 (De-emphasis ON) Preempen: deempen = 10 (Pre-emphasis ON) Preempen: deempen = 11 (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 11.25mV 11.25mV 11.25mV/11.25mV 010 16.9mV 16.9mV 16.9mV/16.9mV 011 (default) 28.15mV 28.15mV 28.15mV/ 28.15mV 100 28.15mV 28.15mV 28.15mV/28.15mV 101 39.35mV 39.35mV 39.35mV/39.35mV 110 45mV 45mV 45mV/45mV 111 56.3mV 56.3mV 56.3mV/56.3mV. **Power Well:** SUS
10:8	0x2 RW	**PerPort HS Transmitter Bias (PERPORTTXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 (De-emphasis ON) Preempen: deempen = 10 (Pre-emphasis ON) Preempen: deempen = 11 (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 11.25mV 11.25mV -11.25mV/11.25mV 010 16.9mV 16.9mV -16.9mV/16.9mV 011 (default) 28.15mV 28.15mV -28.15mV/ 28.15mV 100 28.15mV 28.15mV -28.15mV/28.15mV 101 39.35mV 39.35mV -39.35mV/39.35mV 110 45mV 45mV -45mV/45mV 111 56.3mV 56.3mV -56.3mV/56.3mV **Power Well:** SUS
7:4	0x0 RW	**PORTRESERVED_0123 (PORTRESERVED):** PORTRESERVED (PORTRESERVED): Reserved pin for future functionality of the respective ports **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW	**CL TX EMI Reduction Circuit Bypass (CLTXEMIREDCCTBYPASS):** Chicken bit for CL TX EMI reduction circuit bypass. Assert 1 to bypass the EMI reduction circuit. Default is 0b. AFE pin remains as PORTRESERVED for this project. **Power Well:** SUS
2	0x0 RW	**PERPORT ALLPORTZ (PERPORTALLPORTZ):** Legacy pin. No longer carries any functionality as the pull-down enable is now controlled by ilane5:0usbpdnen_h **Power Well:** SUS
1	0x0 RW	**PERPORT PPDPDMBSEL (PERPORTPPDPDMBSEL):** Config bit to select comparator 2:1 mux input either dp or dm for HS TX per port current calibration 1 - select dp (for debug purpose only) 0 - select dm (without 1.5K pullup) **Power Well:** SUS
0	0x1 RW	**PERPORT TX EOS protection enable (PERPORTTXEOS):** Set to 1b enables the TX EOS protection. To protect high speed driver passgate. This feature is not required for P1269.8. **Power Well:** SUS

5	0x0 RW	**EOSPROTECTBYPASS:** Assert to 1b to disable the EOS protection circuit on the RX HS input passgate. This bit is not applicable to P1269.8. **Power Well:** SUS
4	0x0 RW	**RXDISCSAMPLEBYPASS:** Assert to 1b to override the txdiscsample signal to HS RX disconnect detector for test mode so that HS RX disconnect detector can be tested. **Power Well:** SUS
3	0x0 RW	**Dynamic Pre-emphasis Control Feature (TXPEDYNEN):** Config bit (global to all ports) 1: Assert to 1b to enable the dynamic pre-emphasis jamming control during SOF EOP. Enables dynamic control of txdiscsample from the SIP side, which gives better differential voltage during SOF EOP when asserted during this time, for a more reliable disconnect detection. 0: It is will gate pre-emphasis jamming control iusbtxdiscsample_h signal when set to 0b. This only impacts the TX and not the RX. **Power Well:** SUS
2	0x1 RW	**TXDISCPEHALFOFF:** Config bit (global to all ports) to select the jamming magnitude when TXPEDYNEN is enabled. The jamming magnitude option as below: 1 -- select half pre-emphasis strength 0 - select full pre-emphasis strength **Power Well:** SUS
1	0x1 RW	**Low Power Mode (LOWPWREN):** Assert to 1b to enable the low power mode TX EOS biasing circuit. De-assert to 0b to disable the low power mode as a chicken bit. This bit is not applicable for P1269.8 process which uses 3.3V TG devices but applicable for P1271 process which uses 1.8V TG devices. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**Clock Gating Feature (CLKG):** Clock gating configuration bit (global to all ports). Controls the usbclkgenb signal. 1 - disable clock gating feature 0 - enable clock gating feature **Power Well:** SUS

7.14.7 USB2 PLL1 (USB2_PLL1)—Offset 7F02h

Access Method

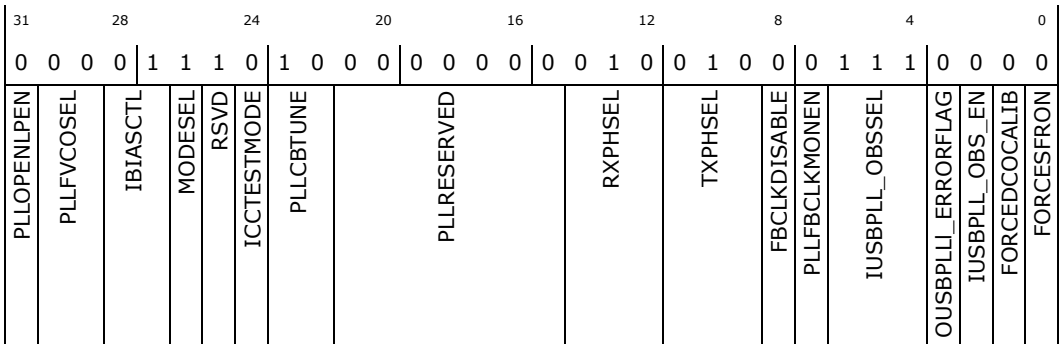
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F02h

Op Codes:

h - Read, h - Write

Default: 0E802470h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**PLLOPENLPEN:** Feed directly to SHIP or AFE : AFE Functional or Test Mode : Functional/Test Mode Set to 1b to enter PLL open loop mode. VCO frequency is determined by ipllvrefsel(3:0) bits. Default: 1 b0 **Power Well:** SUS
30:29	0x0 RW	**PLLFVCOSEL:** PLL VCO frequency select bus. These bits should be set by the CORE based on the vco target frequency. That will help optimize PLL performance (Rj and Lock time). Note that this takes effect only when ipllconfig(1:0)=00 ipllfvcosel(1:0) LBW frequency HBW frequency 11 3.3 - 3.6GHz) 3.5GHz 10 2.75 - 3.3GHz 3.0 - 3.5GHz 01 2.3 - 2.75GHz 2.5 - 3.0GHz 00- Default 1.8 - 2.3GHz andlt; 2.5GHz Default: 2 b00 (for 1.92GHz) If only a single VCO frequency is used then set the default according to the table above or even hard tie it (no registers are required) **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
28:27	0x1 RW	**IBIASCTL:** Bias control for the Input Buffer. High Rbias is for lower current. Low Rbias is for better jitter performance (higher current). ibiascntl(1) 0 0 1 1 ibiascntl(0) 0 1 0 1 Rbias 10k 5k 6k 3.75k Default: 2b01 (5k) **Power Well:** SUS
26	0x1 RW	**MODESEL:** Changes the common mode of the reference clock to the input buffer Default for dot0 = 0, for dot1/2 = 1 This will make iusbibiascntl(1:0) default optimum for dot process. (5k for dot0 and 10k for dot1/2) **Power Well:** SUS
25	0x1 RW	**RSVD:** RSVD **Power Well:** SUS
24	0x0 RW	**ICCTESTMODE:** Input from Sus. During icctestmode, diff amp will be disabled. Output irusbclkout will be pulled up to high **Power Well:** SUS
23:22	0x2 RW	**PLLCBTUNE:** This bus is ignored by default. In order to use it, set iusbpllconfig(0) to 1 or iusbpllopenlpen to 1 When ipllconfig(0)= 0 the PLL automatically chooses the best cbtune for best Rj performance and ignores this bus This bus controls the amount of capacitance that loads the VCO. As VCO loaded with more capacitance: 1. Current increases 2. Jitter improves 00 - least capacitance 11 - max capacitance For better performance use these values based on freq range: Default: 2 b11 (for 1.92GHz) ipllcbtune(1:0) LBW frequency HBW frequency 00- Default) 3.1GHz) 3.5GHz 01 2.6 - 3.1GHz 3.0 - 3.5GHz 10 2.2 - 2.6GHz 2.5 - 3.0GHz 11 andlt; 2.2GHz andlt; 2.5GHz **Power Well:** SUS
21:15	0x0 RW	**PLLRESERVED:** Reserved pins for future use **Power Well:** SUS
14:12	0x2 RW	**RXPHSEL:** This bit only selects which HSIO clock phase to send to core. Receiver phase select bits Default is to select ph(2) from 8-phase (ph7:0) clocks. **Power Well:** SUS
11:9	0x2 RW	**TXPHSEL:** Transmit phase select bits. This bit selects which phase to be sent to port TX. Default is to select ph(2) from 8-phase (ph7:0) clocks **Power Well:** SUS
8	0x0 RW	**FBCLKDISABLE:** PLL Feedback Clock Disable - Disable the feedback clock in the PLL FUB, this is intended to simulate and validate the YANK detect circuitry in the PLL analog core: 1 - PLL feedback path disabled 0 - PLL feedback path enabled **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**PLLFBCLKMONEN:** To enable PLL feedback monitoring mode during PLL BI 1 - enable monitor mode 0 - disable monitor mode VISA needs to be configured to monitor this feedback clock. **Power Well:** SUS
6:4	0x7 RW	**ADPLL OBS SELECT (IUSBPLL_OBSSEL):** This signal is used to select ADPLL signal for monitoring at local port (used together with iusbpll_obs_en): 000 - o_obs(0) 001 - o_obs(1) 010 - o_obs(2) 011 - o_obs(3) 100 - refclkview 101 - fbclkview others - vss Default = 111 **Power Well:** SUS
3	0x0 RO	**ADPLL ERROR FLAG (OUSBPLLl_ERRORFLAG):** ADPLL ERROR FLAG: indicator for a violation in PLL (overflow issues, PLL lost lock, etc). Routed also to VISA. Details of the violation could be found in VISA outputs **Power Well:** SUS
2	0x0 RW	**ADPLL OBS (IUSBPLL_OBS_EN):** ADPLL: This signal is used to select between pllbypassclk or ADPLL monitor signal to be sent through clock repeater to local port for observation. It needs to be used together with iusbpllbypass (set to 1). 0 - Select pllbypassclk 1 - Select ADPLL signals for monitoring through local port Default = 0 **Power Well:** SUS
1	0x0 RW	**FORCEDCOCALIB:** To force dco calibration in c73usb250_normal locking. Required if user wishes to change DCO frequency 1 - force DCO calibration. 0 - c73usb250_normal operation. No DCO frequency change. **Power Well:** SUS
0	0x0 RW	**FORCESFRON:** To forces SFR on when DCO is disabled for faster lock time. Sampled by refclk only while pllen=0. This is not used for USB2 PHY. 1 - force SFR ON. 0 - force SFR OFF. **Power Well:** SUS

7.14.8 USB2 PLL2 (USB2_PLL2)—Offset 7F03h

Access Method

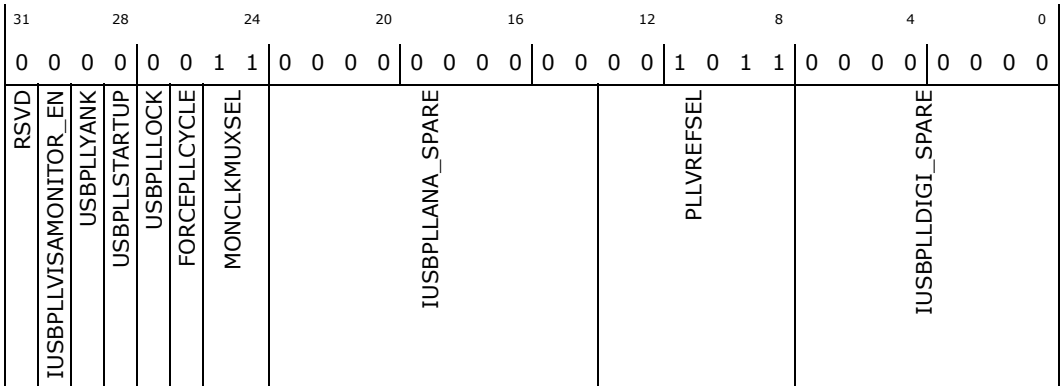
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F03h

Op Codes:

h - Read, h - Write

Default: 03000B00h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**RSVD:** Reserved. **Power Well:** SUS
30	0x0 RW	**PLL VISA MONITOR (IUSBPLLVISAMONITOR_EN):** 0 - Gate visa monitor clocks to save power during functional mode (default). 1 - Ungate visa monitor clocks during debug. **Power Well:** SUS
29	0x0 RO	**USBPLLYANK:** Output to Core. Indicates the PLL feedback loop has been open for some time while the analog core is enabled. When asserted high, V1 is forced to a voltage that brings the VCO frequency well within the c73usb250_normal operating range of the feedback path logic 1 - YANK condition detected 0 - c73usb250_normal operation ** This signal goes HIGH if VCO output goes idle due to bad startup **Power Well:** SUS
28	0x0 RO	**USBPLLSTARTUP:** Output to Core. Startup Pulse - indicates the analog core has recently been enabled, LOCK acquisition begins on the falling edge of this output 1 - STARTUP condition detected 0 - PLL lock acquisition in progress, the PLL is locked or the analog core is disabled ** This signal goes HIGH during PLL startup phase **Power Well:** SUS
27	0x0 RO	**USBPLLLOCK:** Output to Core. Lock Indicator 1 - PLL is LOCKED (as indicated by the Lock Detect timer expiring) 0 - PLL is Not Locked NOTE: Time or Application Critical operations should not depend on the accuracy or validity of this output **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
26	0x0 RW/1S	**FORCEPLLCYCLE:** Force PLL Cycle: When set, the PLL SM will sequence a shutdown of PLL, followed by startup. Bit is cleared by HW once the PLL cycle has completed. A write of 0 has no impact. This flow is similar to the dynamic PLL shutdown flow, where the core reset is not asserted, but the PLL related clocks are gated/enabled cleanly. It is expected that SW will set this bit only when the EHCI RUN bit is cleared (HALTED set). This bit will take effect regardless of the Disable Dynamic PLL **Power Well:** SUS
25:24	0x3 RW	**MONCLKMUXSEL:** Bits for selecting clock to monitor through VISA: 00 - reference clock 01 - coreclk480 10 - adpll fbclkview 11 - vss (default) **Power Well:** SUS
23:14	0x0 RW	**ADPLL ANA SPARE (IUSBPLLANA_SPARE):** Spare input config pins. **Power Well:** SUS
13:8	0xb RW	**PLLVREFSEL:** This bus is ignored by default. In order to use it, set iusbpllconfig(1) to 1 or iusbpllopenlpen to 1 On functional mode these bits control PLL startup voltage reference. When iusbpllconfig(1)= 0 the PLL automatically chooses the best vrefsel for fastest lock time and ignores this bus In open loop mode (iusbpllopenlpen=1) these bits control the VCO frequency Default (dot0 LBW/HBW): 6 b001011 **Power Well:** SUS
7:0	0x0 RW	**ADPLL DIGI SPARE (IUSBPLLDIGI_SPARE):** Spare input config pins. **Power Well:** SUS

7.14.9 USB2 COMPBG (USB2_COMPBG)—Offset 7F04h

Access Method

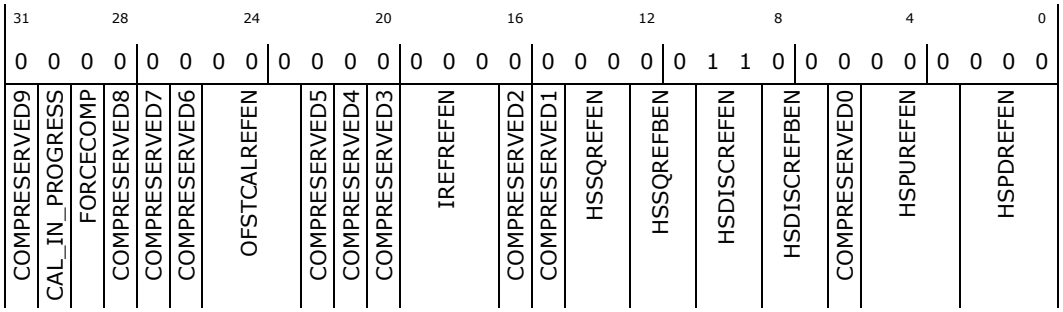
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F04h

Op Codes:

h - Read, h - Write

Default: 00000600h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**COMPRESERVED9:** Spare bits related to compensation. **Power Well:** SUS
30	0x0 RO	**CAL IN PROGRESS (CAL_IN_PROGRESS):** This bit is to indicate that Compensation State Machine is still in progress and rcomp/icomp value are not yet updated **Power Well:** SUS
29	0x0 WO	**FORCECOMP:** When set to 1b, this will force global comp Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. This is a pulse trigger event. **Power Well:** SUS
28	0x0 RW	**COMPRESERVED8:** Spare bits related to compensation. **Power Well:** SUS
27	0x0 RW	**COMPRESERVED7:** Spare bits related to compensation. **Power Well:** SUS
26	0x0 RW	**COMPRESERVED6:** Spare bits related to compensation. **Power Well:** SUS

7.14.30 RCOMP REGISTER (RCOMP_REGISTER)—Offset 7F09h

Access Method

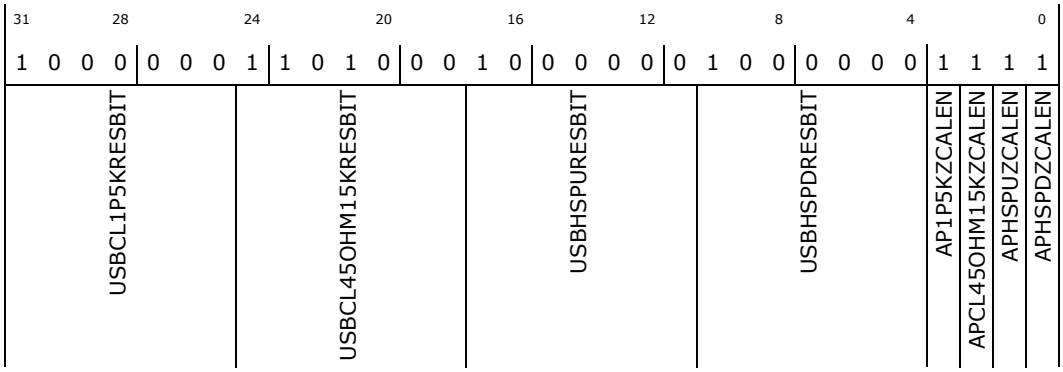
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F09h

Op Codes:

h - Read, h - Write

Default: 81A2040Fh



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x40 RO/V	**USBCL1P5KRESBIT:** Device mode CL 1.5K RCOMP bits coming from core logic to set the CL 1.5k pull-up impedance value. This register is hard coded, These bits are binary weighted and are for device mode classic 1.5k pull-up calibration. These bits will always change during RCAL to tune the termination resistance **Power Well:** SUS
24:18	0x68 RO/V	**USBCL45OHM15KRESBIT:** CL 45 ohm/15K RCOMP bits coming from core logic to set the CL 45 ohm/15k pull-down impedance value. This register is hard coded, These bits are binary weighted and are for classic 45 ohm/15k pull-down calibration. These bits will always change during RCAL to tune the termination resistance **Power Well:** SUS
17:11	0x40 RO/V	**USBHSPURESBIT:** HS PU RCOMP bits coming from core logic to set the HS pull-up impedance value. This register is hard coded, These bits are binary weighted and are for HS TX pull-up calibration. These bits will always change during RCAL to tune the termination resistance **Power Well:** SUS
10:4	0x40 RO/V	**USBHSPDRESBIT:** HS PD RCOMP bits coming from core logic to set the HS pull-down impedance value. This register is hard coded, These bits are binary weighted and are for HS TX pull-down calibration. These bits will always change during RCAL to tune the termination resistance **Power Well:** SUS
3	0x1 RW	**AP1P5KZCALEN:** Set it to 1b to enable Device Mode 1.5K Pull Up hardware based RCAL. **Power Well:** SUS
2	0x1 RW	**APCL45OHM15KZCALEN:** Set it to 1b to enable CL 45 Ohm/15K Pull Down hardware based RCAL. **Power Well:** SUS
1	0x1 RW	**APHSPUZCALEN:** Set it to 1b to enable HS Pull-up hardware based RCAL. **Power Well:** SUS
0	0x1 RW	**APHSPDZCALEN:** Set it to 1b to enable HS Pull-Down hardware based RCAL. **Power Well:** SUS

7.14.31 ICOMP REGISTER (ICOMP_REGISTER)—Offset 7F0Ah

Access Method

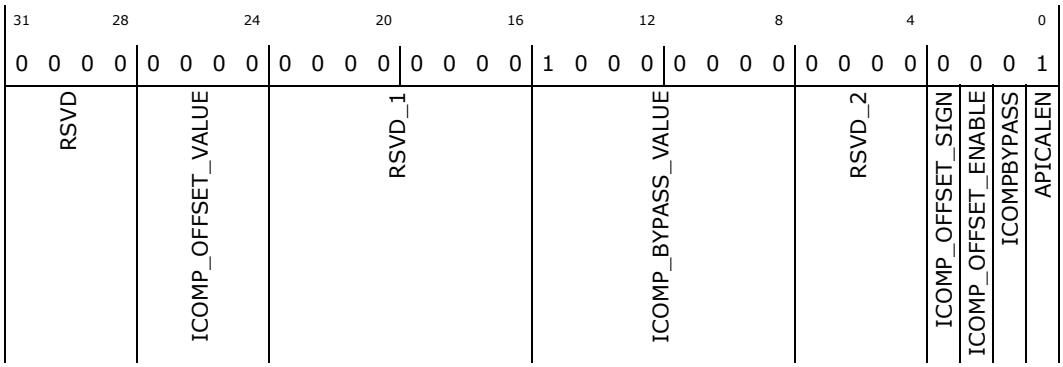
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F0Ah

Op Codes:

h - Read, h - Write

Default: 00008001h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD:** Reserved **Power Well:** SUS
27:24	0x0 RW	**ICOMP OFFSET VALUE (ICOMP_OFFSET_VALUE):** icomp offset value The state machine has the ability to manipulate the evaluated values as desired with the programmable offset and override adjustments for the value that going to be updated in the AFE. Once steady state 1-0-1 or 0-1-0 is detected on curcountup and icomp offset enable bit is set, an offset will be added, with the amount of offset programmable via this configuration bits. **Power Well:** SUS
23:16	0x0 RO	**RSVD (RSVD_1):** Reserved **Power Well:** SUS
15:8	0x80 RW	**ICOMP BYPASS VALUE (ICOMP_BYPASS_VALUE):** Icomp bypass value The ability to bypass the ICOMP compensated binary value with this value that is going to be updated in the AFE when icompbypass bit is set. **Power Well:** SUS
7:4	0x0 RO	**RSVD (RSVD_2):** Reserved **Power Well:** SUS
3	0x0 RW	**ICOMP OFFSET SIGN (ICOMP_OFFSET_SIGN):** icomp offset sign bit 1 - incrementing offset value 0 - decrementing offset value **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW	**ICOMP OFFSET ENABLE (ICOMP_OFFSET_ENABLE):** icomp offset enable bit 1 - enable icomp offset override 0 - disable icomp offset override **Power Well:** SUS
1	0x0 RW	**ICOMPBYPASS:** Icomp bypass mode. config controlled. 1 - enable icomp bypass 0 - disable icomp bypass **Power Well:** SUS
0	0x1 RW	**APICALEN:** Set it to 1b to enable hardware based ICAL. **Power Well:** SUS

7.14.32 USB2 TEST GLOBAL REG1 (USB2_TEST_GLOBAL_REG1)—Offset 400Bh

Access Method

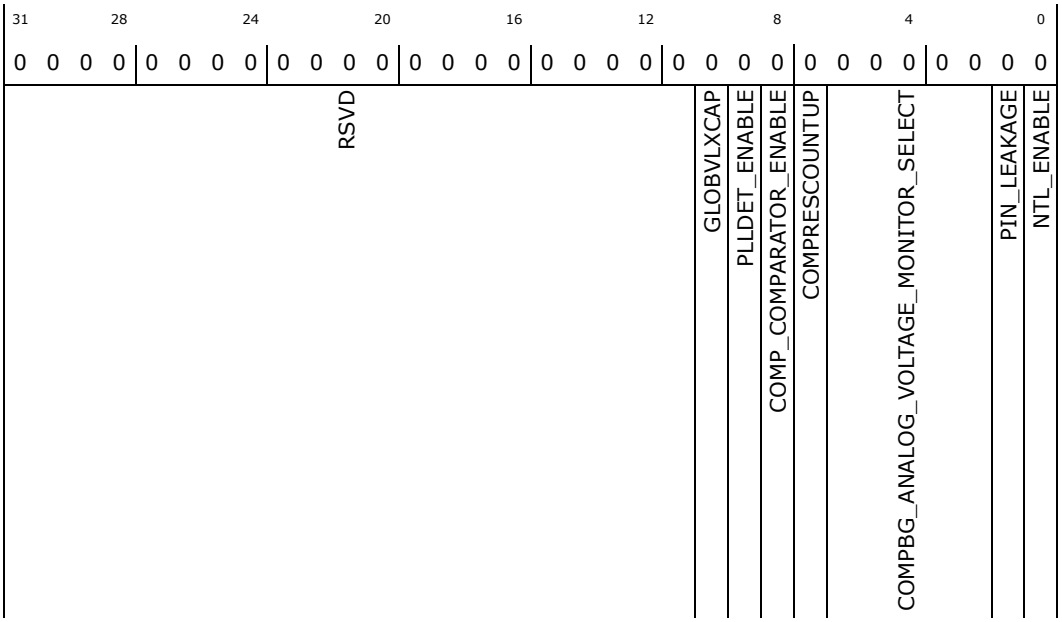
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 400Bh

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RO	**RSVD:** Reserved. **Power Well:** SUS
10	0x0 RW	**Global VIx Capture (GLOBVLXCAP):** 1: Captures the live values from AFE. Test SW is required to allow enough settling time before setting this bit. 0: Allows the live values to propagate into register fields. **Power Well:** SUS
9	0x0 RW	**PLLDET ENABLE (PLLDET_ENABLE):** PLL determinism enable bit. (Bit is not applicable for 1271) **Power Well:** SUS
8	0x0 RW	**COMP COMPARATOR ENABLE (COMP_COMPARATOR_ENABLE):** If set, COMP comparator is enabled. iusbhspucalen_h will be forced to 1 . Iusbtxcuren_h will be forced to 0 . iusbhspuresbit(6:0) and iusbhspdresbit(6:0) will be forced to 0 . **Power Well:** SUS
7	0x0 RO	**COMPRESCOUNTUP:** bit is set, the last value from this amp is re-circulated to allow test SW to reliably read it **Power Well:** SUS
6:2	0x0 RW	**COMPBG ANALOG VOLTAGE MONITOR SELECT (COMPBG_ANALOG_VOLTAGE_MONITOR_SELECT):** Change from 4 bits to 5 bits. 00000 =) (default) 00001 =) Select vcccoreport_1p0_lv for powerdroop detect 00010 =) Select vccsusport_1p0_lv for powerdroop detect 00011 =) Current calibration N-channel biasing voltage 00100 =) Current calibration P-channel biasing voltage 00101 =) select vccdusbsus_1p0_lv for powerdroop detect 00110 =) reserve for future use 00111 =) HS pull-up calibration Vref 01000 =) Current Calibration Vref 01001 =) Classic 15K pull-up Calibration Vref 01010 =) Comparator Offset Calibration Vref 01011 =) HS Disconnect Vref 01100 =) HS Squelch Vref+ 01101 =) HS Squelch Vref- 01110 =) LDO monitoring signals 01111 onwards =) reserve for future use **Power Well:** SUS

Access Method

Type: Message Bus Register (Size: 32 bits)

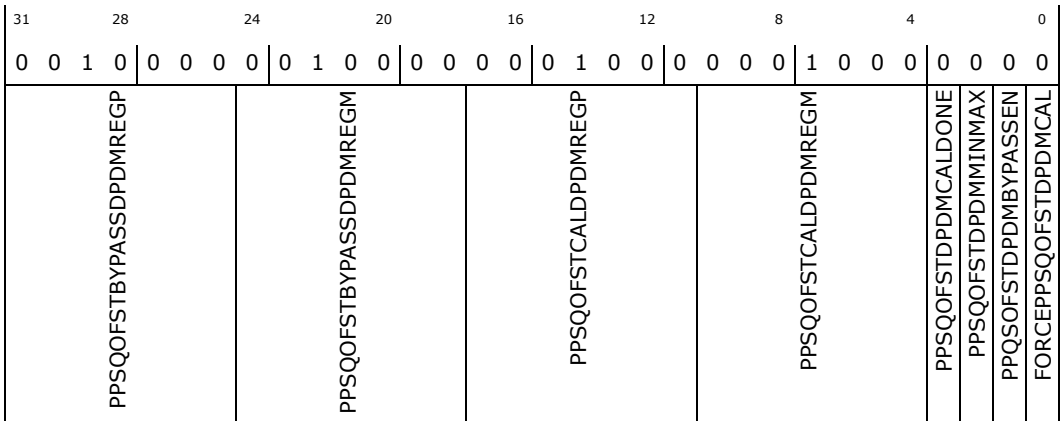
Offset: [Port:] + 411Bh

Op Codes:

h - Read, h - Write

Default: 20404080h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x10 RW	**PPSQOFSTBYPASSDPDMREGP:** Software programmable. It is used during test mode. The values of AFE pins ilane13:0usbppsqofstcaldpdmregp(6:0) will be overwritten by this register when ppsqofstDPDMBYPASSEN is asserted 1 . **Power Well:** SUS
24:18	0x10 RW	**PPSQOFSTBYPASSDPDMREGM:** Software programmable. It is used during test mode. The values of AFE pins ilane13:0usbppsqofstcaldpdmregm(6:0)will be overwritten by this register when ppsqofstDPDMBYPASSEN is asserted 1 . **Power Well:** SUS
17:11	0x8 RO	**PPSQOFSTCALDPDMREGP:** 7-bit register that stores the DpDm squelch detector offset cancellation Dm-side code. This 7-bit register must be initialized to default value prior to every calibration routine (before FORCEPPSQOFSTDPDMCAL asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to ppsqofstcaldpdmregM. This is to reduce the signal common mode variation to impact to circuit performance. If unsquelch output is low when FORCEPPSQOFSTDPDMCAL asserted: regP count up regM countdown regP count up until unsquelch output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If unsquelch output is high when FORCEPPSQOFSTDPDMCAL asserted: regP countdown regM count up regP countdown until squelch output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. Note: bit 10:9 are unused for P1269.8. **Power Well:** SUS
10:4	0x8 RO	**PPSQOFSTCALDPDMREGM:** 7-bit register that stores the DpDm squelch detector offset cancellation Dp side code. This 7-bit register must be initialized to default value prior to every calibration routine (before FORCEPPSQOFSTDPDMCAL asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to ppsqofstcaldpdmregP. This is to reduce the signal common mode variation to impact to circuit performance. If unsquelch output is low when FORCEPPSQOFSTDPDMCAL asserted: regP count up regM countdown regP count up until unsquelch output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If unsquelch output is high when FORCEPPSQOFSTDPDMCAL asserted: regP countdown regM count up regP countdown until squelch output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. Note: bit 10:9 are unused for P1269.8. **Power Well:** SUS
3	0x0 RO	**PPSQOFSTDPDMCALDONE:** This bit is set to 1b by state machine to indicate the calibration completion. This bit need to be cleared when FORCEppsqofstDPDMcal (starting of next calibration cycle). **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C	**PPSQOFSTDPDMMINMAX:** Flag bit when ppsqofstcaldpdmregP OR ppsqofstcaldpdmregM offset counter reach the max range. The max range high limit is set by USBSQOFSTDPDMMAXLIMIT and low limit is always 0000000b. For P1269.8 is when it reaches 0011111b or 0000000b. This is to prevent roll back when the variation is out of range. This bit is to be cleared by software. **Power Well:** SUS
1	0x0 RW	**PPQSOFSTDPDMBYPASSEN:** Software programmable. The values of ilane13:0usbppsqofstcaldpdmregp(6:0) and ilane13:0usbppsqofstcaldpdmregm(6:0) will be overwritten by ppsqofstbypassdpdmregp and ppsqofstbypassdpdmregm respectively when this bit assert 1b . **Power Well:** SUS
0	0x0 WO	**DpDm SQ Offset Calibration Enable Signal (FORCEPPSQOFSTDPDMCAL):** When set to 1b, this will force per-port squelch offset cancellation Finite State Machine to start calibrating. State Machine need to ensure only either DpDm or DmDp SQ detector is enabled for calibration at each time. BIOS have to wait for sufficient time for the calibration complete. This is a pulse trigger event. **Power Well:** SUS

The max range high limit is set by USBSQOFSTDPDMMAXLIMIT and low limit is always 0000000b. For P1271 is when it reaches 0011111b or 0000000b. This is to prevent roll back when the variation is out of range. This bit is to be cleared by software. **Power Well:** SUS
1	0x0 RW	**PPSQOFSTDMDPBYPASSEN:** Software programmable. The values of ilane13:0usbppsqofstcaldmdpregm(6:0) and ilane13:0usbppsqofstcaldmdpregp(6:0) will be overwritten by ppsqofstbypassdmdpregm and ppsqofstbypassdmdpregp respectively when this bit assert 1b . **Power Well:** SUS
0	0x0 WO	**DmDp SQ Offset Calibration Enable Signal (FORCEPPSQOFSTDMDPCAL):** When set to 1b, this will force per-port squelch offset cancellation Finite State Machine to start calibrating. State Machine need to ensure only either DmDp or DmDp SQ detector is enabled for calibration at each time. BIOS have to wait for sufficient time for the calibration complete. This is a pulse trigger event. **Power Well:** SUS

7.14.70 USB2 DIS OFFSET PERPORT REG (USB2_DIS_OFFSET_PERPORT_REG_PP0)—Offset 411Dh

Access Method

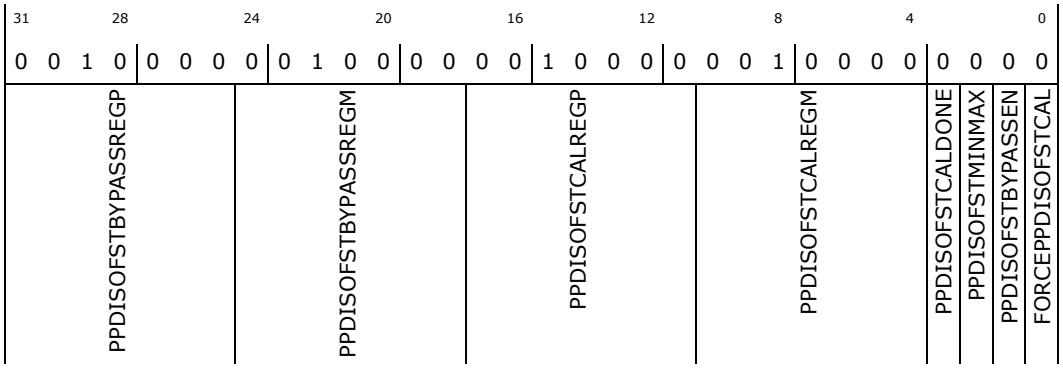
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 411Dh

Op Codes:

h - Read, h - Write

Default: 20408100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x10 RW	**PPDISOFSTBYPASSREGP:** Software programmable. It is used during test mode. The values of ilane13:0usbppDISofstcalregp(6:0) will be overwritten by this register when ppDISofstbypassen is asserted 1 . **Power Well:** SUS
24:18	0x10 RW	**PPDISOFSTBYPASSREGM:** Software programmable. It is used during test mode. The values of ilane13:0usbppdisofstcalregm(6:0) will be overwritten by this register when ppDISofstbypassen is asserted 1 . **Power Well:** SUS
17:11	0x10 RO	**PPDISOFSTCALREGP:** 7-bit register that stores the disconnect detector offset cancellation left-side code. This 7-bit register must be initialized to default value prior to every calibration routine (before PPDISOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to right-register. This is to reduce the signal common mode variation to impact to circuit performance. If hsdisconnect output is low when FORCEPPDISOFSTCAL asserted: regP count down regM count up regP count down until hsdisconnect output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If hsdisconnect output is high when FORCEPPDISOFSTCAL asserted: regM countdown regP count up regM countdown until hsdisconnect output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. Note: bit 7:6 are unused for P1271. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
10:4	0x10 RO	**PPDISOFSTCALREGM:** 7-bit register that stores the disconnect detector offset cancellation right-side code. If hsdisconnect output is high when FORCEPPDISOFSTCAL asserted: regM countdown regP count up regM countdown until hsdisconnect output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. Note: bit 10:9 are unused for P1271. **Power Well:** SUS
3	0x0 RO	**PPDISOFSTCALDONE:** This bit is set to 1b by state machine to indicate the calibration completion. This bit need to be cleared when FORCEPPDISofstcal (starting of next calibration cycle). **Power Well:** SUS
2	0x0 RW/1C	**PPDISOFSTMINMAX:** Flag bit when ppDISofstcalregp OR ppDISofstcalregm offset counter reach the max limit set by the product. For P1269.8 is when it reaches 0001111b or 0000000b. This is to prevent roll back when the variation is out of range. **Power Well:** SUS
1	0x0 RW	**PPDISOFSTBYPASSEN:** Software programmable. The values of ilane13:0usbppDISofstcalregp(6:0) and ilane13:0usbppDISofstcalregm(6:0) will be overwritten by ppDISofstbypassregp and ppDISofstbypassregm respectively when ppDISofstbypassen is asserted 1 . **Power Well:** SUS
0	0x0 WO	**FORCEPPDISOFSTCAL:** When set to 1b, this will force per-port disconnect offset cancellation Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. **Power Well:** SUS

7.14.83 USB2 SQDIS OFFSET GLOBAL REG (USB2_SQDIS_OFFSET_GLOBAL_REG)—Offset 7F1Eh

Access Method

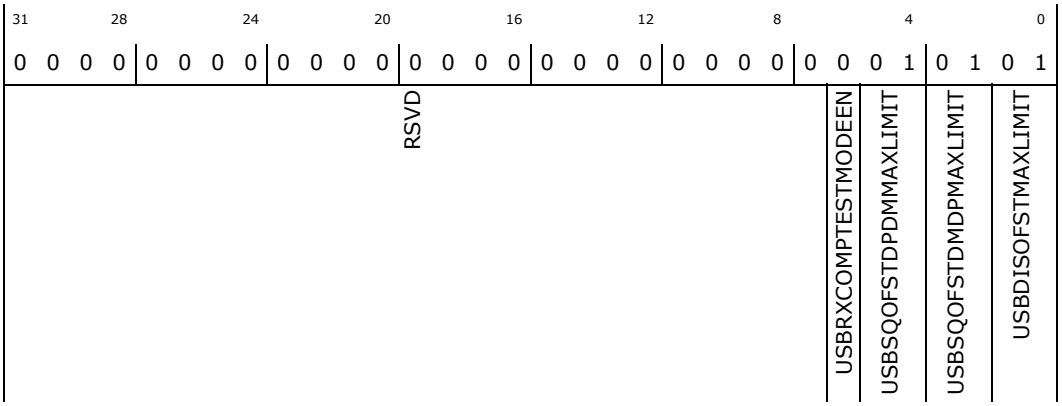
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F1Eh

Op Codes:

h - Read, h - Write

Default: 00000015h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved. **Power Well:** SUS
6	0x0 RW	**USBRXCOMPTESTMODEEN:** This global bit connects directly to AFE ilane(0:13)usbrxcomptestmodeen. When this bit is asserted, SQ DpDm detector, SQ DmDp Detector and Disc detector Opamp differential inputs will be disconnected from Vref/Vrefb voltage and will have the direct connection to Pad voltage. This allow offset to be introduced through Dp/Dm for offset cancellation max range and monotonous characterization purposes. **Power Well:** SUS
5:4	0x1 RW	**USBSQOFSTDPDMMAXLIMIT:** This register defines the counter limit for the DpDm SQ offset cancellation SM. 11b = 7-bits 10b = 6-bits 01b = 5-bits 00b = 4-bits **Power Well:** SUS
3:2	0x1 RW	**USBSQOFSTDMDPMAXLIMIT:** This register defines the counter limit for the DmDp SQ offset cancellation SM. 11b = 7-bits 10b = 6-bits 01b = 5-bits 00b = 4-bits **Power Well:** SUS
1:0	0x1 RW	**USBDISOFSTMAXLIMIT:** This register defines the counter limit for the Disconnect detector offset cancellation SM. 11b = 7-bits 10b = 6-bits 01b = 5-bits 00b = 4-bits This limit applies to the GLB COMPARATOR calibration as well. **Power Well:** SUS

7.14.84 USB2 DEVICE MODE GLOBAL REG (USB2_DEVICE_MODE_GLOBAL_REG)—Offset 401Fh

Access Method

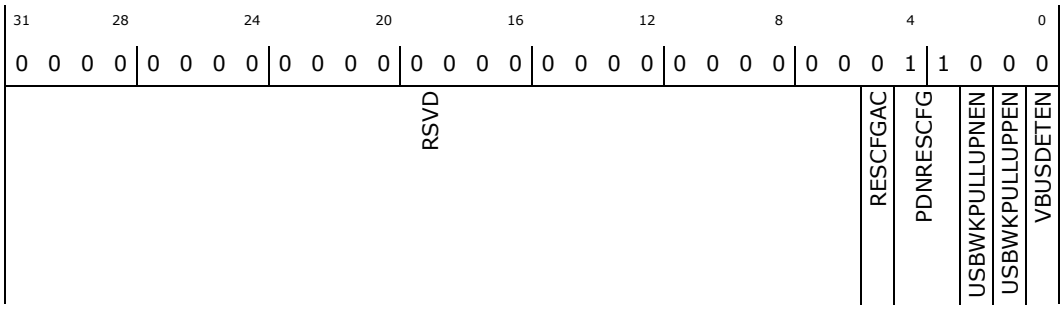
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 401Fh

Op Codes:

h - Read, h - Write

Default: 00000018h



Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD:** Reserved. **Power Well:** SUS
5	0x0 RW	**DEVICE STATIC VS DYNAMIC (RESCFGAC):** Enable register based control versus dynamic control for OTG host and device switching. 1: Enable register control (PDNRESCFG - 0x1F, 4:3). 0: Dynamic control based on utmi dp/dm pulldown. **Power Well:** SUS
4:3	0x3 RW	**PDNRESCFG:** Feed directly to SHIP or AFE : AFE Functional or Test Mode : Functional Config bit (global to all ports) Feed directly to SHIP or AFE : AFE Functional or Test Mode : Functional To select the pull-down resistive dividers (15k, 250k , mtg 30k) Host: 11b (default) Device: 10b (default) The pull-down resistive divider is used to step down the common mode level of the input differential signal to meet electrical spec of input receivers. **Power Well:** SUS
2	0x0 RW	**USBWKPULLUPNEN:** Set 1b to enable the 1.5kohm pull-up on MINUS pads of the respective port to support OTG. This bit is only used for test mode. This CSR bit OR with signal from pputmi, then output to AFE This reg is not applicable for P1269.8 **Power Well:** SUS
1	0x0 RW	**USBWKPULLUPPEN:** Set to 1b to enable the 1.5kohm pull-up on PLUS pads of the respective port to support OTG. This bit is only used for test mode. This CSR bit OR with signal from pputmi, then output to AFE. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**VBUSDETEN:** Set to 1b to enable the VBUS comparator which is used for debug or test purposes. During debug mode, andlt;VBUS_valid) pin could be observed through VISA. Additional VISA configuration is required to mux this signal out to observation port. This CSR bit OR with signal from pputmi, then output to AFE. **Power Well:** SUS

7.14.85 USB2 TEST GLOBAL SERIAL LOOPBACK (USB2_TEST_GLOBAL_SERIAL_LOOPBACK)—Offset 4020h

Access Method

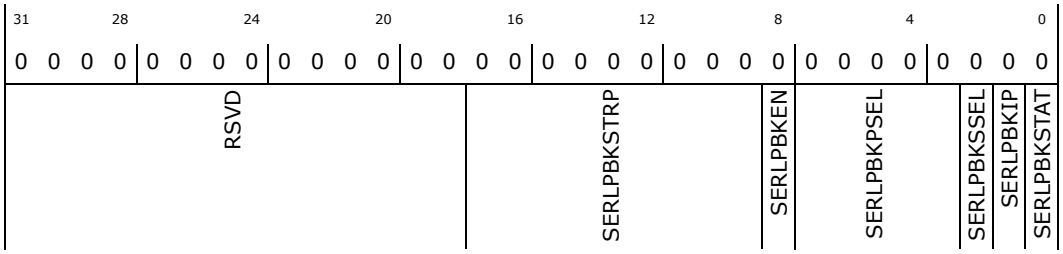
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4020h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD:** RSVD **Power Well:** SUS
17:9	0x0 RW	**Serial Loopback Strobe Points (SERLPBKSTRP):** Speed Begin Mid End FS 12d (Ch) 22d (16h) 32d (20h) LS 167d (A7h) 169d (A9h) 172d (ACh) These points define the reliable strobing of the D-/+ on the AFE during loopback. Bits are allowed to change only when loopback mode has stopped. It is expected that the Strobe Point is done prior to starting the serial loopback mode. **Power Well:** SUS
8	0x0 RW	**Serial Loopback Enable (SERLPBKEN):** 1: Start serial loopback mode within SHIP. 0: Stop serial loopback mode within SHIP. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RW	**Serial Loopback Port Select[M:0] (SERLPBKPSEL):** Selects the physical port number to run the loopback test: 0: Port 0 1: Port 1 ... N: Port N Bit is allowed to change only when loopback mode has stopped. It is expected that the port select is done prior to starting the serial loopback mode. **Power Well:** SUS
2	0x0 RW	**Serial Loopback Speed Select (SERLPBKSSEL):** 1: FS 0: LS Bit is allowed to change only when loopback mode has stopped. It is expected that the speed select is done prior to starting the serial loopback mode. **Power Well:** SUS
1	0x0 RO	**Serial Loopback In Progress (SERLPBKIP):** 1: Serial loopback mode is in progress. 0: Serial loopback mode has stopped. **Power Well:** SUS
0	0x0 RW/1C	**Serial Loopback Status (SERLPBKSTAT):** bit. Status is only valid once loopback mode has fully stopped. **Power Well:** SUS

7.14.86 USB2 GLOBAL COMP CMP OFFSET REG (USB2_GLOBAL_COMP_CMP_OFFSET_REG)—Offset 7F21h

Access Method

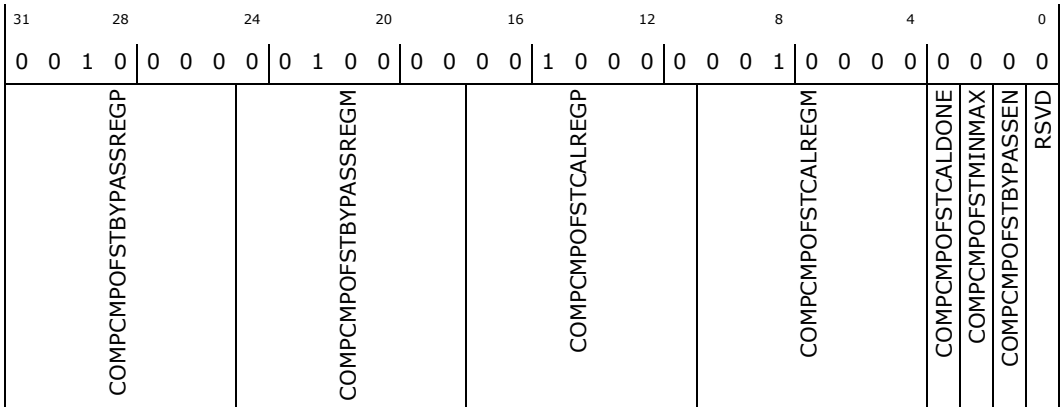
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F21h

Op Codes:

h - Read, h - Write

Default: 20408100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x10 RW	**COMPCMPOFSTBYPASSREGP:** Software programmable. It is used during test mode. The values of iusbcompcmpofstcalregp(6:0) will be overwritten by this register when compcmpofstbypassen is asserted 1 . **Power Well:** SUS
24:18	0x10 RW	**COMPCMPOFSTBYPASSREGM:** Software programmable. It is used during test mode. The values of iusbcompcmpofstcalregm(6:0) will be overwritten by this register when compcmpofstbypassen is asserted 1 . **Power Well:** SUS
17:11	0x10 RO	**COMPCMPOFSTCALREGP:** 7-bit register that stores the comparator offset cancellation left-side code. This 7-bit register must be initialized to default value prior to every calibration routine (before COMPCMPOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to rightt-register. This is to reduce the signal common mode variation to impact to circuit performance. If comparator output (rescountup) is low when FORCEPPCOMPCMPOFSTCALDPDMEN asserted: regP count down regM count up regP count down until comparator output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If comparator output (rescountup) is high when FORCECOMPCMPOFSTCALDPDMEN asserted: regM countdown regP count up regM countdown until comparator output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. **Power Well:** SUS
10:4	0x10 RO	**COMPCMPOFSTCALREGM:** 7-bit register that stores the comparator offset cancellation right-side code. This 7-bit register must be initialized to default value prior to every calibration routine (before COMPCMPOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to left-register. This is to reduce the signal common mode variation to impact to circuit performance. 8	0x0 RW	**DISSLEWCTL:** DISSLEWCTL (DISSLEWCTL): Feed directly to SHIP or AFE : AFE Functional or Test Mode : Functional 0 - enable slew rate control during Classic Tx (default) 1 - disable slew rate control during Classic Tx **Power Well:** SUS
7:5	0x2 RW	**CLSLEWCTLPD:** Pull-Down Slew rate control for Classic Low Speed Tx 000 - slowest slew rate 001 - slow slew rate 010 - c73usb250_Normal (default) 100 - fast slew rate **Power Well:** SUS
4:2	0x2 RW	**CLSLEWCTLPU:** Slew rate control for Classic Low Speed Tx 000 - slowest slew rate 001 - slow slew rate 010 - c73usb250_Normal (default) 100 - fast slew rate **Power Well:** SUS
1:0	0x0 RW	**HSNPREDRVSEL:** Delay/skews strength Control for HS driver. Use together with HSSKEWSEL. npredrvsel(1) | npredrvsel(0) | Skew Offset 0 | 0 | No Skew (default) 0 | 1 | 30mV 1 | 0 | 40mV 1 | 1 | 50mV **Power Well:** SUS

7.14.104 USB2 PLL3 (USB2_PLL3)—Offset 7F27h

Access Method

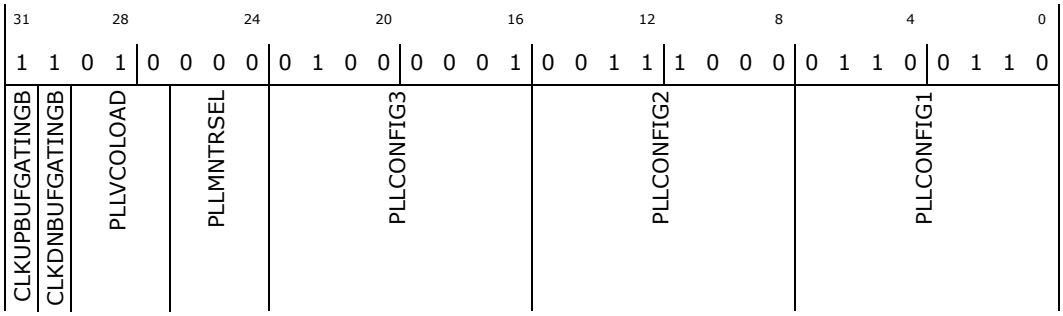
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 7F27h

Op Codes:

h - Read, h - Write

Default: D0413866h



Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**CLKUPBUFGATINGB:** Power saving on upper lane clocking. Set to 0b clock gates all clock buffers to upper lane AFE ports. Default is 1b. This bit does not gate coreclk480. **Power Well:** SUS
30	0x1 RW	**CLKDNBUFGATINGB:** Power saving on lower lane clocking. Set to 0b clock gates all clock buffers to lower lane AFE ports. Default is 1b. This bit does not gate coreclk480. **Power Well:** SUS
29:27	0x2 RW	**PLLVCOLOAD:** Controls the amount of capacitance that loads the VCO. These bits should be set by logic based on vco target frequency. These bits can also optimize power/jitter tradeoffs in case its needed For USBPLL the pins control power/jitter trade off (000 least power/most jitter). ipllvcoload(2:0) LBW VCO (GHz) HBW VCO (GHz) 000 3.3 - 3.6 3.5 - 4.267 001 2.75 - 3.3 3.0 - 3.5 010 2.25 - 2.75 2.5 - 3.0 011 1.8 - 2.25 2.133 - 2.5 Default: According to default VCO frequency. For USBPLL default is 010 the VCO. **Power Well:** SUS
26:24	0x0 RW	**PLLMNTRSEL:** PLL analog monitor mux select mntrsel opllmntr(1) opllmntr(0) 000 (default) VSS VSS 001 Vvcr Ivcr 010 Vctrl_pbias Ivco_tail 011 Vvcr_diode Ivcr_diode 100 Vnbias_ext Inbias 101 Vdrain_nbias Inbias 110 V1dac vccd 111 V1p vcca Default: 8b000 **Power Well:** SUS
23:16	0x41 RW	**PLLCONFIG3:** General PLL configuration signals #3 (7:6) - startup ramp (5) - sleep/yank counter (4:3) - fast lock mode (2) - new startup DAC (1) - use 50uA current reference (0) - enable vco phases 1 and 3 Default: 8 b01000001 **Power Well:** SUS
15:8	0x38 RW	**PLLCONFIG2:** General PLL configuration signals #2 (7:5) - lock threshold (4:3) - lock div select (2:0) - lock counter Default: 8 b00111000 **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x66 RW	**PLLCONFIG1:** General PLL configuration signals #1 (7:5) - residual pulse width (4:1) - chopper width control (0) - open loop mode enable Default: 8 b01100110 **Power Well:** SUS

7.14.105 PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP0)—Offset 4128h

Access Method

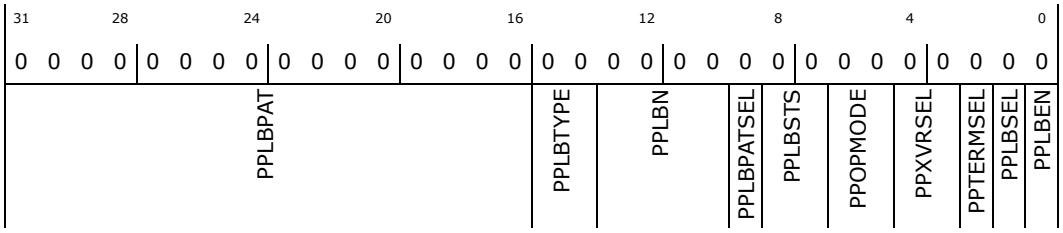
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4128h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Per port Loopback Pattern (PPLBPAT):** 2-byte pattern used during loopback. Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern. This field is only applicable when PPLBPATSEL = 0b. **Power Well:** SUS
15:14	0x0 RW	**Per port Loopback Type (PPLBTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 00b: Digital Near-End Loopback (DNELB) 01b: Analog Near-End Loopback (ANELB) 10b: Analog Far-End Loopback (AFELB) 11b: Reserved **Power Well:** SUS
13:10	0x0 RW	**Per Port Loop Number (PPLBN):** Number of repeatable fixed pattern within a packet. Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW	**Per port Loopback Pattern Select (PPLBPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet **Power Well:** SUS
8:7	0x0 RW/1C	**Per Port Loopback Status Reporting (PPLBSTS):** 00b: Loopback not started 01b: Loopback Pass 10b: Pattern mismatch 11b: Receive error SW writes a 11b to clear the status back to 00b. **Power Well:** SUS
6:5	0x0 RW	**Per Port Operational Mode (PPOPMODE):** Operational Mode in test mode. These signals select between various operational modes: 00b: c73usb250_Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved This field is only applicable when PPLBSEL = 1b. **Power Well:** SUS
4:3	0x0 RW	**Per Port Transceiver Select (PPXVRSEL):** This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved This field is only applicable when PPLBSEL = 1b. **Power Well:** SUS
2	0x0 RW	**Per Port Termination Select (PPTERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled This field is only applicable when PPLBSEL = 1b. **Power Well:** SUS
1	0x0 RW	**Per Port DFX Loopback Select (PPLBSEL):** Loopback select to choose loopback path. 1: select loopback path 0: select functional path **Power Well:** SUS
0	0x0 RW	**Per Port Loopback Enable (PPLBEN):** This bit will enable loopback test mode. 1: Enable loopback 0: Disable loopback **Power Well:** SUS

7.14.106 PER PORT LOOPBACK CONTROL (PER_PORT_LOOPBACK_CONTROL_PP1)—Offset 4228h

Access Method

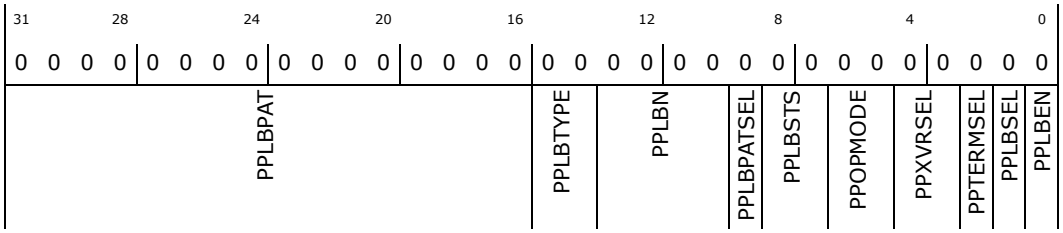
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4228h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Per port Loopback Pattern (PPLBPAT):** 2-byte pattern used during loopback. Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern. This field is only applicable when PPLBPATSEL = 0b. **Power Well:** SUS
15:14	0x0 RW	**Per port Loopback Type (PPLBTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 00b: Digital Near-End Loopback (DNELB) 01b: Analog Near-End Loopback (ANELB) 10b: Analog Far-End Loopback (AFELB) 11b: Reserved **Power Well:** SUS
13:10	0x0 RW	**Per Port Loop Number (PPLBN):** Number of repeatable fixed pattern within a packet. Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) **Power Well:** SUS

7.14.110 GLB ADP OFFSET REG (GLB_ADP_OFFSET_REG)—Offset 4029h

Access Method

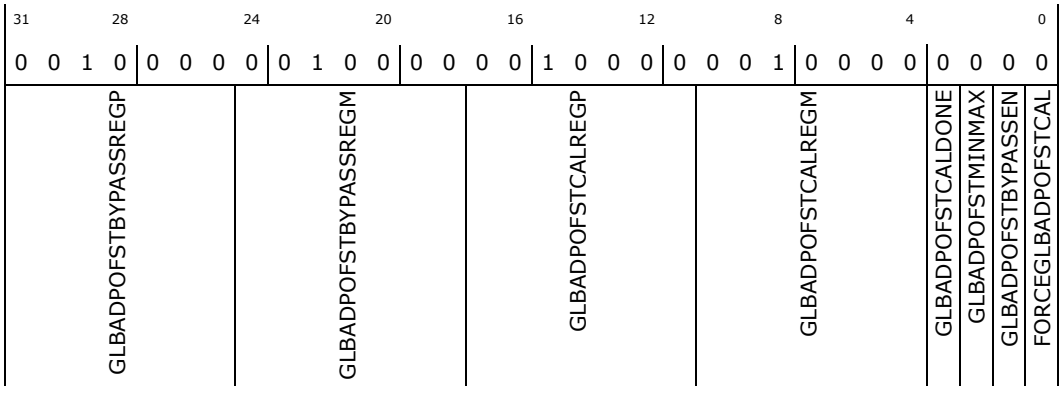
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4029h

Op Codes:

h - Read, h - Write

Default: 20408100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x10 RW	**GLBADPOFSTBYPASSREGP:** Software programmable. It is used during test mode. The values of glbbADPofstcalreg(9:5) will be overwritten by this register when glbADPofstbypassen is asserted 1. **Power Well:** SUS
24:18	0x10 RW	**GLBADPOFSTBYPASSREGM:** Software programmable. It is used during test mode. The values of glbADPofstcalreg(4:0) will be overwritten by this register when glbADPofstbypassen is asserted 1. **Power Well:** SUS
17:11	0x10 RO	**GLBADPOFSTCALREGP:** 5-bit register that stores the ADP probe comparator offset cancellation left-side code. This 5-bit register must be initialized to default value prior to every calibration routine (before GLBADPOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to right-register. This is to reduce the signal common mode variation to impact to circuit performance. If oadpprbusblvgen output is low when FORCEGLBADPOFSTCAL asserted: regP count down -) regM count up -) regP count down -) until oadpprbusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If oadpprbusblvgen output is high when FORCEGLBADPOFSTCAL asserted: regM countdown -) regP count up -) regM countdown -) until oadpprbusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. **Power Well:** SUS
10:4	0x10 RO	**GLBADPOFSTCALREGM:** 5-bit register that stores the ADP probe comparator offset cancellation right-side code. This 5-bit register must be initialized to default value prior to every calibration routine (before GLBADPOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to left-register. This is to reduce the signal common mode variation to impact to circuit performance. If oadpprbusblvgen output is low when FORCEGLBADPOFSTCAL asserted: regP count down -) regM count up -) regP count down -) until oadpprbusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If oadpprbusblvgen output is high when FORCEGLBADPOFSTCAL asserted: regM countdown -) regP count up -) regM countdown -) until oadpprbusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. **Power Well:** SUS
3	0x0 RO	**GLBADPOFSTCALDONE:** This bit is set to 1b by state machine to indicate the calibration completion. This bit need to be cleared when FORCEGLBADPOFSTCAL (starting of next calibration cycle). **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C	**GLBADPOFSTMINMAX:** Flag bit when glbADPofstcalregp OR glbADPofstcalregm offset counter reach the max limit set by the product. For P1271 is when it reaches 01111b or 00000b. This is to prevent roll back when the variation is out of range. **Power Well:** SUS
1	0x0 RW	**GLBADPOFSTBYPASSEN:** Software programmable. The values of glbADPofstcalreg(9:5) and glbADPofstcalreg(4:0) will be overwritten by ADPofstbypassregp and glbADPofstbypassregm respectively when glbADPofstbypassen is asserted 1. **Power Well:** SUS
0	0x0 WO	**FORCEGLBADPOFSTCAL:** When set to 1b, this will force ADP probe detect comparator offset cancellation Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. **Power Well:** SUS

7.14.111 GLB VBUS OFFSET REG (GLB_VBUS_OFFSET_REG)—Offset 402Ah

Access Method

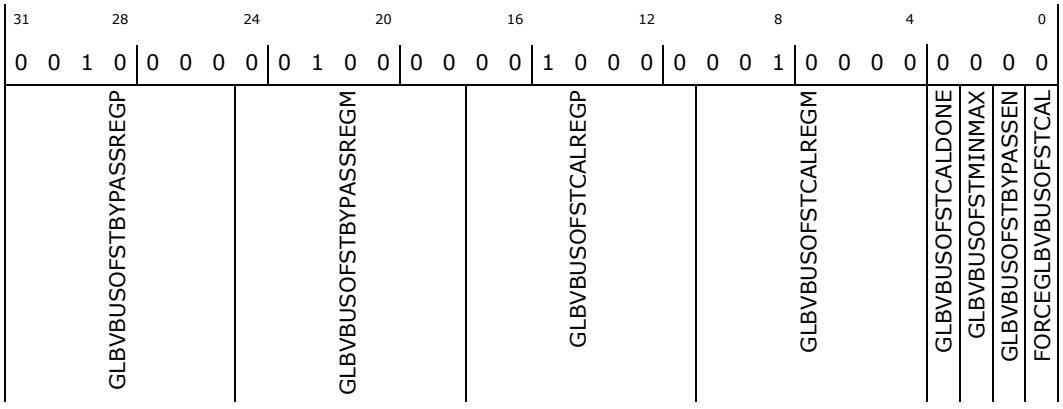
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Ah

Op Codes:

h - Read, h - Write

Default: 20408100h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0x10 RW	**GLBVBUSOFSTBYPASSREGP:** Software programmable. It is used during test mode. The values of glbVBUSofstcalreg(9:5) will be overwritten by this register when glbVBUSofstbypassen is asserted 1. **Power Well:** SUS
24:18	0x10 RW	**GLBVBUSOFSTBYPASSREGM:** Software programmable. It is used during test mode. The values of glbVBUSofstcalreg(4:0) will be overwritten by this register when glbVBUSofstbypassen is asserted 1. **Power Well:** SUS
17:11	0x10 RO	**GLBVBUSOFSTCALREGP:** 5-bit register that stores the VBUS valid comparator offset cancellation left-side code. This 5-bit register must be initialized to default value prior to every calibration routine (before GLBVBUSOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to right-register. This is to reduce the signal common mode variation to impact to circuit performance. If ovbusvldusblvgen output is low when FORCEGLBVBUSOFSTCAL asserted: regP count down -) regM count up -) regP count down -) until ovbusvldusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If ovbusvldusblvgen output is high when FORCEGLBVBUSOFSTCAL asserted: regM countdown -) regP count up -) regM countdown -) until ovbusvldusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. **Power Well:** SUS
10:4	0x10 RO	**GLBVBUSOFSTCALREGM:** 5-bit register that stores the VBUS valid comparator offset cancellation right-side code. This 5-bit register must be initialized to default value prior to every calibration routine (before GLBVBUSOFSTCALEN asserted). The binary value is step through sequentially, in alternating cycle and in opposite polarity with respect to left-register. This is to reduce the signal common mode variation to impact to circuit performance. If ovbusvldusblvgen output is low when FORCEGLBVBUSOFSTCAL asserted: regP count down -) regM count up -) regP count down -) until ovbusvldusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 101010 sequences to indicate calibration completion. If ovbusvldusblvgen output is high when FORCEGLBVBUSOFSTCAL asserted: regM countdown -) regP count up -) regM countdown -) until ovbusvldusblvgen output produce a 0-1 transition. The register is manipulated by FSM to produce 010101 sequences to indicate calibration completion. **Power Well:** SUS
3	0x0 RO	**GLBVBUSOFSTCALDONE:** This bit is set to 1b by state machine to indicate the calibration completion. This bit need to be cleared when FORCEGLBVBUSOFSTCAL (starting of next calibration cycle). **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C	**GLBVBUSOFSTMINMAX:** Flag bit when glbVBUSofstcalregp OR glbVBUSofstcalregm offset counter reach the max limit set by the product. For P1271 is when it reaches 01111b or 00000b. This is to prevent roll back when the variation is out of range. **Power Well:** SUS
1	0x0 RW	**GLBVBUSOFSTBYPASSEN:** Software programmable. The values of glbVBUSofstcalreg(9:5) and glbVBUSofstcalreg(4:0) will be overwritten by glbVBUSofstbypassregp and glbVBUSofstbypassregm respectively when glbVBUSofstbypassen is asserted 1. **Power Well:** SUS
0	0x0 WO	**FORCEGLBVBUSOFSTCAL:** When set to 1b, this will force VBUS valid detect comparator offset cancellation Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. **Power Well:** SUS

7.14.112 GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG)—Offset 402Bh

Access Method

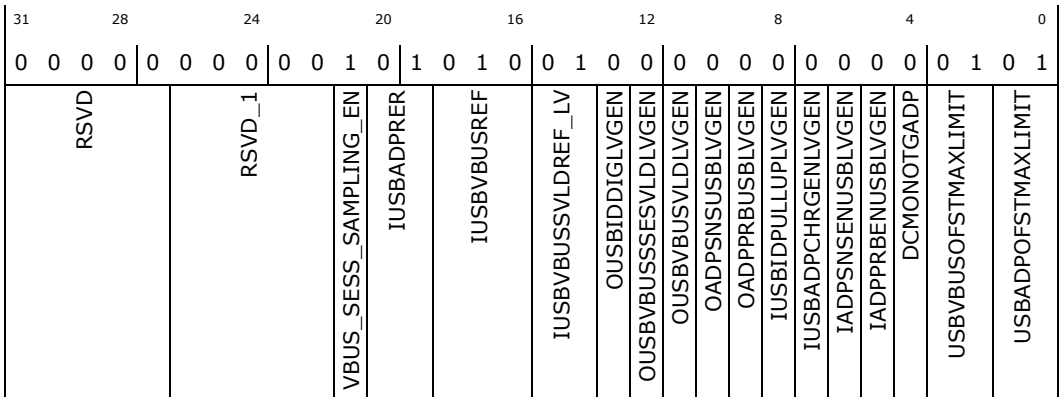
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Bh

Op Codes:

h - Read, h - Write

Default: 002A4005h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
26:22	0x0 RW	**RESERVED (RSVD_1):** Reserved. **Power Well:** SUS
21	0x1 RW	**VBUS SESSION SAMPLING ENABLE (VBUS_SESS_SAMPLING_EN):** Enable vbus session comparator for vbus and session sampling. **Power Well:** SUS
20:19	0x1 RW	**IUSBADPRER:** Adp vref select signal 2'b00 = 0.65 2'b01 = 0.675 2'b10 = 0.7 2'b11 = 0.725 **Power Well:** SUS

13	0x0 RO	**OUSBIDDIGLVGEN:** OTG ID dig status readout. **Power Well:** SUS
12	0x0 RO	**OUSBVBUSSSESVLDLVGEN:** VBUS sense status readout. **Power Well:** SUS
11	0x0 RO	**OUSBVBUSVLDLVGEN:** VBUS valid status readout. **Power Well:** SUS
10	0x0 RO	**OADPSNSUSBLVGEN:** ADP sense status readout. **Power Well:** SUS
9	0x0 RO	**OADPPRBUSBLVGEN:** ADP probe status readout. **Power Well:** SUS
8	0x0 RW	**IUSBIDPULLUPLVGEN:** OTG ID dig pullup enable for DCIO. **Power Well:** SUS
7	0x0 RW	**IUSBADPCHRGENLVGEN:** ADP charge enable for DCIO. **Power Well:** SUS
6	0x0 RW	**IADPSNSENUSBLVGEN:** ADP sense enable for DCIO. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**IADPPRBENUSBLVGEN:** ADP probe enable for DCIO. **Power Well:** SUS
4	0x0 RW	**DC OTG ADP MONITOR (DCMONOTGADP):** Enable DC monitor for OTG and ADP. **Power Well:** SUS
3:2	0x1 RW	**USBVBUSOFSTMAXLIMIT:** This register defines the counter limit for the VBUS valid detector offset cancellation SM. 11b = not supporting 10b = not supporting 01b = 5-bits 00b = 4-bits **Power Well:** SUS
1:0	0x1 RW	**USBADPOFSTMAXLIMIT:** This register defines the counter limit for the ADP probe detector offset cancellation SM. 11b = Not supporting 10b = Not supporting 01b = 5-bits 00b = 4-bits **Power Well:** SUS

7.14.113 USB2 GLOBAL PORT 2 (USB2_GLOBAL_PORT_2)—Offset 402Ch

Access Method

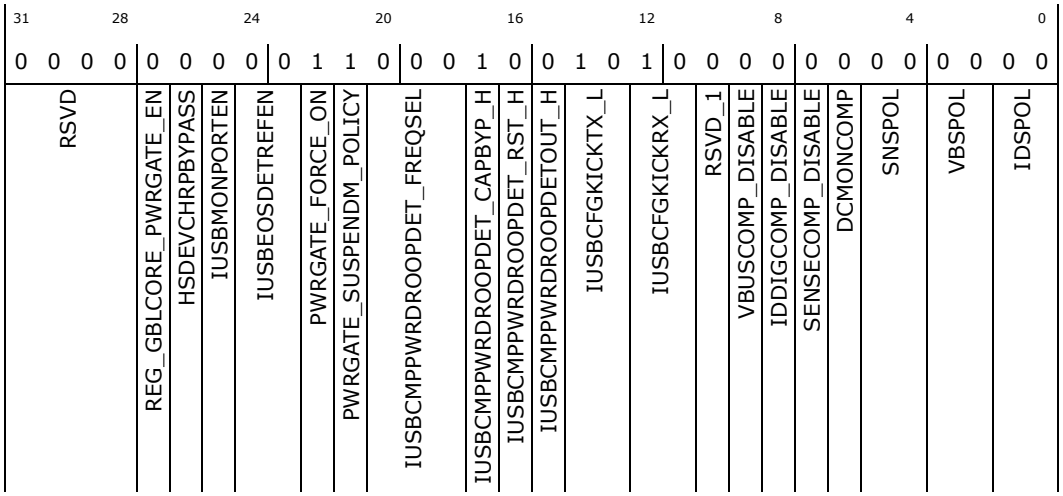
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Ch

Op Codes:

h - Read, h - Write

Default: 00625000h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
27	0x0 RW	**Global lane core power gating enable (REG_GBLCORE_PWRGATE_EN):** Feed directly to SHIP or AFE: AFE Functional or Test Mode: Test Mode 1: Enable global lane core well shuf off once all ports are off. 0:Disable global lane shut off when all per-port are off. ie. Global lane will remain on and not autonomously shuf off once all ports are off. **Power Well:** SUS
26	0x0 RW	**HSDEVCHRPBYPASS:** Enable to bypass the pull-up on Dm pin during device chirp K mode. **Power Well:** SUS
25	0x0 RW	**Enable monitoring or power droop (IUSBMONPORTEN):** 1b1 when monitoring or power droop detector is enabled. 1b0 when using external clock. **Power Well:** SUS
24:23	0x0 RW	**EOS REFERENCE ENABLE SELECT (IUSBEOSDETREFEN):** Sel signal to select eosdet vref 2'b00 = 0.75V 2'b01 = 0.725V 2'b10 = 0.775V 2'b11 = 0.8V **Power Well:** SUS
22	0x1 RW	**Power gating DFX force on (PWRGATE_FORCE_ON):** 1: Disallow perport power gating. All LDO remains ON regardless of ihost_phy_pwr_req or suspend. 0:Allow dynamic control based on ihost_phy_pwr_req or suspend. **Power Well:** SUS
21	0x1 RW	**Per Port Power gating suspend policy (PWRGATE_SUSPENDM_POLICY):** 1: Per Port power gating based on utmi suspendm only. Once suspendm=0, phy will initiate perport power gating. 0: Per Port power gating based on utmi suspendm and ihost_ppXpwr_req. **Power Well:** SUS
20:18	0x0 RW	**High pass frequency select (IUSBCMPPWRDROOPDET_FREQSEL):** Power droop detect control signals to select for High Pass frequency. 000b - 1MHz 001b - 30MHz 010b - 60MHz 011b - Invalid 100b - Invalid 101b - Invalid 110b - Invalid 111b - Invalid **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
17	0x1 RW	**Bypass capacitor (IUSBCMPPWRDROOPDET_CAPBYP_H):** Signal to bypass the high pass filters capacitor. **Power Well:** SUS
16	0x0 RW	**Power droop detect reset (IUSBCMPPWRDROOPDET_RST_H):** Power droop detect reset signal for common lane. **Power Well:** SUS
15	0x0 RO	**Power droop detect observation (IUSBCMPPWRDROOPDETOUT_H):** Power droop detect output observation signal for common lane. **Power Well:** SUS
14:13	0x2 RW	**Transmit kicker (IUSBCFGKICKTX_L):** Kicker strength control during HS Tx 00 - Turn Off kicker 01 - Lowest kicker strength 10 - Default kicker strength 11 - Highest kicker strength **Power Well:** SUS
12:11	0x2 RW	**Receive kicker (IUSBCFGKICKRX_L):** Kicker strength control during HS Rx 00 - Turn Off kicker 01 - Lowest kicker strength 10 - Default kicker strength 11 - Highest kicker strength **Power Well:** SUS
10	0x0 RW	**RESERVED (RSVD_1):** Reserved. **Power Well:** SUS
9	0x0 RW	**DISABLING AFE VBUS COMPARATOR (VBUSCOMP_DISABLE):** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE vbus comparator 0: Allow dynamic sampling enabling **Power Well:** SUS
8	0x0 RW	**DISABLING AFE IDDIG COMPARATOR (IDDIGCOMP_DISABLE):** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE iddig comparator 0: Allow dynamic sampling enabling **Power Well:** SUS
7	0x0 RW	**DISABLNG AFE SENSE COMPARATOR (SENSECOMP_DISABLE):** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE sense comparator 0: Allow dynamic sampling enabling . **Power Well:** SUS
6	0x0 RW	**DC MONITOR FOR COMPARATOR (DCMONCOMP):** Enable DC monitor for comparator. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
5:4	0x0 RW	**Session valid Sample Policy (SNSPOL):** 00: Bypass 01: Force SNS valid output to 0b to the UTMI+ 10: Force SNS valid output to 1b to the UTMI+ 11: Sample mode (10 ms period) **Power Well:** SUS
3:2	0x0 RW	**VBUS valid Sample Policy (VBSPOL):** 00: Bypass 01: Force VBUS valid output to 0b to the UTMI+ 10: Force VBUS valid output to 1b to the UTMI+ 11: Sample mode (10 ms period) **Power Well:** SUS
1:0	0x0 RW	**IDDIG Sample Policy (IDSPOL):** 00: Bypass 01: Force IDDIG output to 0b to the UTMI+ 10: Force IDDIG output to 1b to the UTMI+ 11: Sample mode (2 ms period) **Power Well:** SUS

7.14.114 GLB CLOCK PORT 0/1 REPEATER (GLB_CLOCK_PORT_0_1_REPEATER)—Offset 402Dh

Access Method

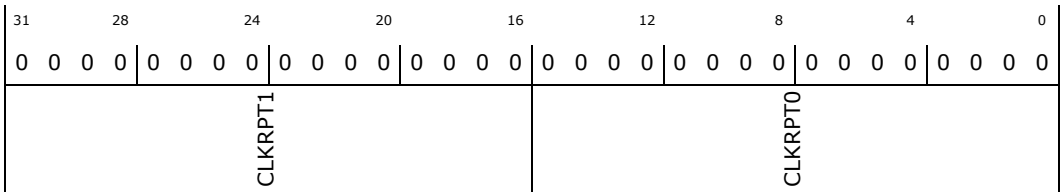
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Dh

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Ports 15:0 for Clk Repeater 1 (CLKRPT1):** These per-port bits feed into Clock Repeater 1 functionality. **Power Well:** SUS
15:0	0x0 RW	**Ports 15:0 for Clk Repeater 0 (CLKRPT0):** These per-port bits feed into Clock Repeater 0 functionality. **Power Well:** SUS

7.14.115 GLB CLOCK PORT 2/3 REPEATER (GLB_CLOCK_PORT_2_3_REPEATER)—Offset 402Eh

Access Method

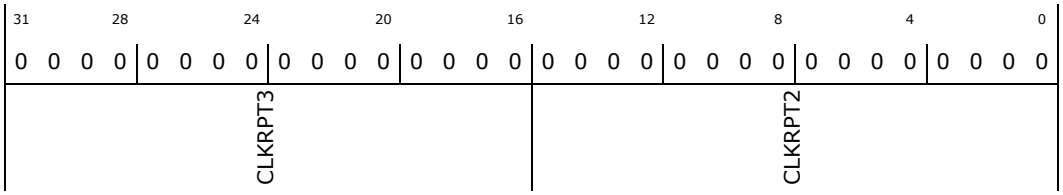
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Eh

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 3 (CLKRPT3):** These per-port bits feed into Clock Repeater 3 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 2 (CLKRPT2):** These per-port bits feed into Clock Repeater 2 functionality. **Power Well:** SUS

7.14.116 GLB CLOCK PORT 4/5 REPEATER (GLB_CLOCK_PORT_4_5_REPEATER)—Offset 402Fh

Access Method

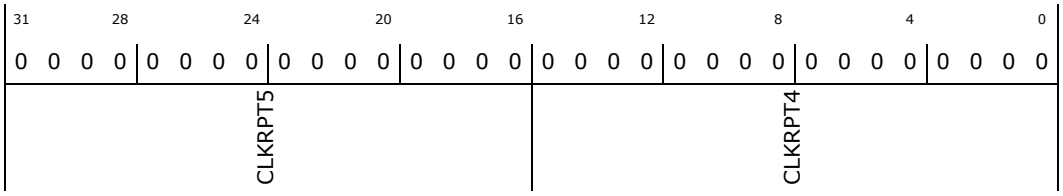
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 402Fh

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 5 (CLKRPT5):** These per-port bits feed into Clock Repeater 5 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 4 (CLKRPT4):** These per-port bits feed into Clock Repeater 4 functionality. **Power Well:** SUS

7.14.117 GLB CLOCK PORT 6/7 REPEATER (GLB_CLOCK_PORT_6_7_REPEATER)—Offset 4030h

Access Method

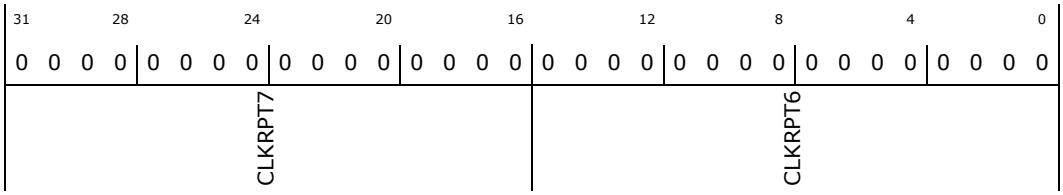
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4030h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 7 (CLKRPT7):** These per-port bits feed into Clock Repeater 7 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 6 (CLKRPT6):** These per-port bits feed into Clock Repeater 6 functionality. **Power Well:** SUS

7.14.118 GLB CLOCK PORT 8/9 REPEATER (GLB_CLOCK_PORT_8_9_REPEATER)—Offset 4031h

Access Method

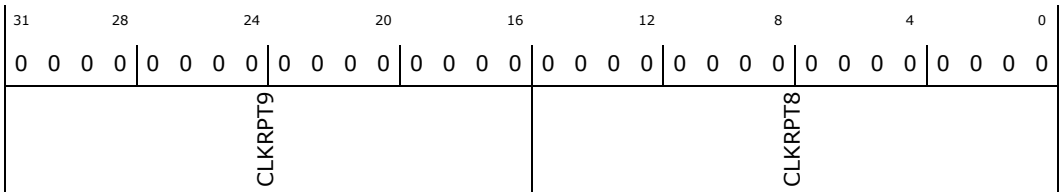
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4031h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 9 (CLKRPT9):** These per-port bits feed into Clock Repeater 9 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 8 (CLKRPT8):** These per-port bits feed into Clock Repeater 8 functionality. **Power Well:** SUS

7.14.119 GLB CLOCK PORT 10/11 REPEATER (GLB_CLOCK_PORT_10_11_REPEATER)—Offset 4032h

Access Method

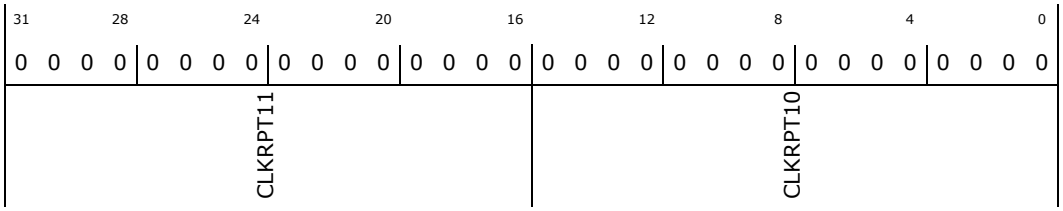
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4032h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 11 (CLKRPT11):** These per-port bits feed into Clock Repeater 11 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 10 (CLKRPT10):** These per-port bits feed into Clock Repeater 10 functionality. **Power Well:** SUS

7.14.120 GLB CLOCK PORT 12/13 REPEATER (GLB_CLOCK_PORT_12_13_REPEATER)—Offset 4033h

Access Method

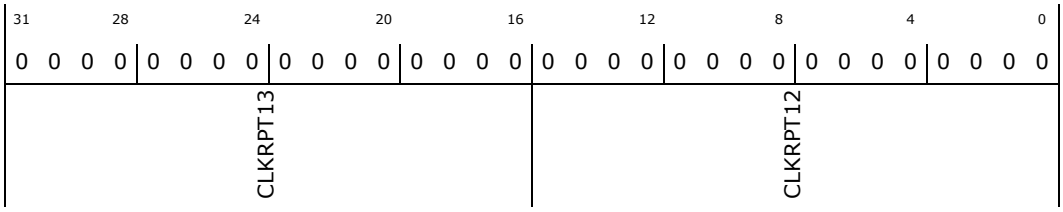
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4033h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 13 (CLKRPT13):** These per-port bits feed into Clock Repeater 13 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 12 (CLKRPT12):** These per-port bits feed into Clock Repeater 12 functionality. **Power Well:** SUS

7.14.121 GLB CLOCK PORT 14/15 REPEATER (GLB_CLOCK_PORT_14_15_REPEATER)—Offset 4034h

Access Method

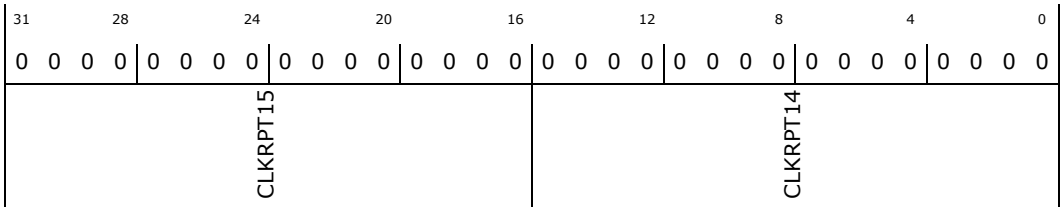
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4034h

Op Codes:

h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 15 (CLKRPT15):** These per-port bits feed into Clock Repeater 15 functionality. **Power Well:** SUS
15:0	0x0 RW	**PORTS 15:0 FOR CLK REPEATER 14 (CLKRPT14):** These per-port bits feed into Clock Repeater 14 functionality. **Power Well:** SUS

7.14.122 GLB LDO MSTR REG 1 (GLB_LDO_MSTR_REG_1)—Offset 4035h

Access Method

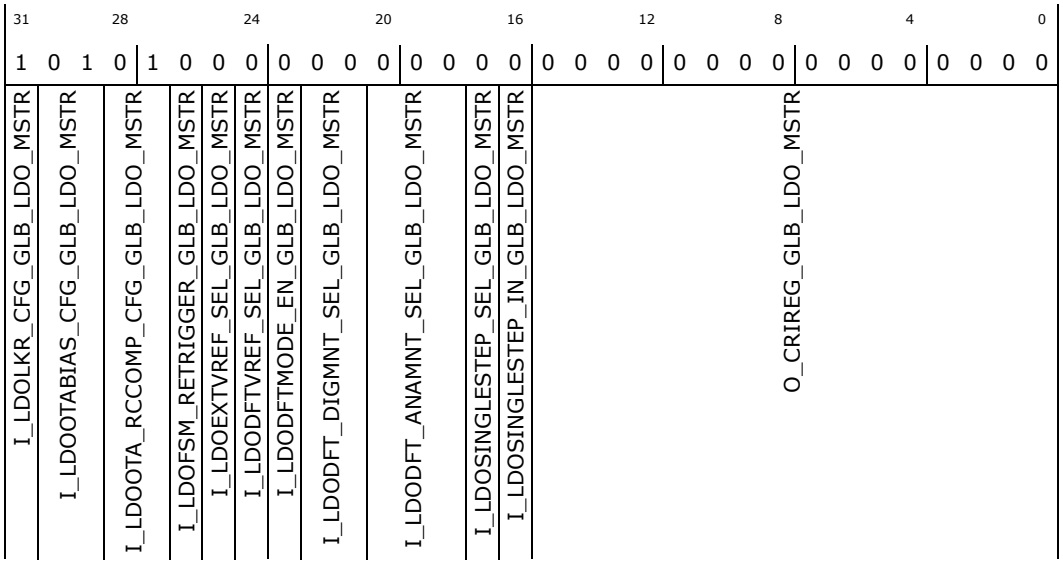
Type: Message Bus Register (Size: 32 bits)

Offset: [Port:] + 4035h

Op Codes:

h - Read, h - Write

Default: A8000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**LDO leaker programmability (I_LDOLKR_CFG_GLB_LDO_MSTR):** LDO: leaker programmability signal **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
30:29	0x1 RW	**LDO OTA tail current bias programmability (I_LDOOTABIAS_CFG_GLB_LDO_MSTR):** LDO: OTA tail current bias programmability **Power Well:** SUS

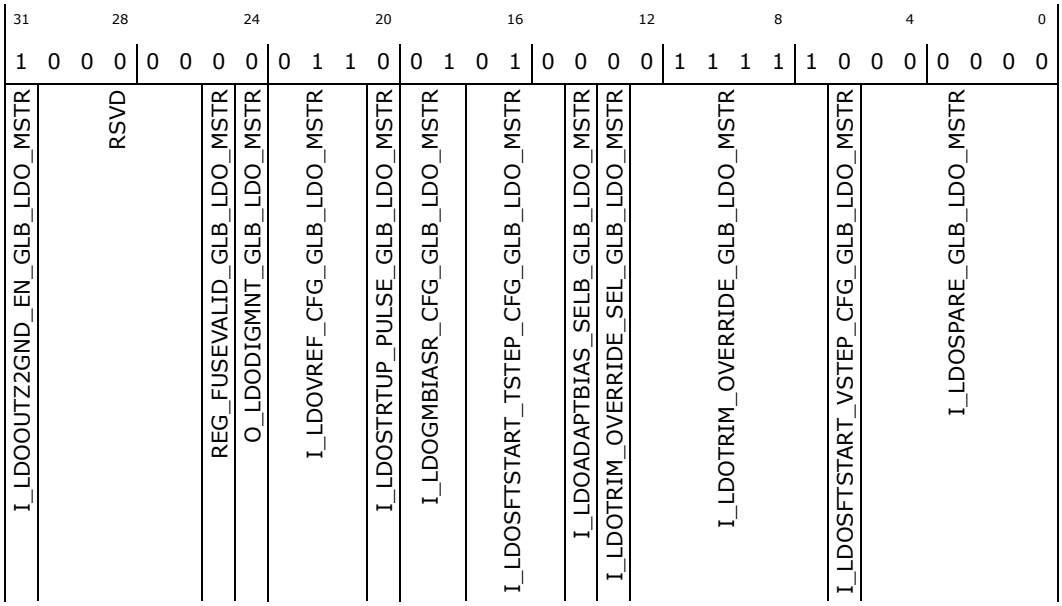
Default: 80650F80h



Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**LDO VCC output gnd or Z (I_LDOOUTZ2GND_EN_PP_LDO_SLV):** When (i_ldooutz2gnd_en AND i_pwrreq_xldo1p0)=1, the corresponding LDO output (vcc_primldo1p0_lv) vcc_xldo1p0_lv=0, otherwise, high-z. **Power Well:** SUS
30:25	0x0 RW	**RSVD:** Reserved for future use. **Power Well:** SUS
24	0x0 RO	**LDO digital monitor (O_LDODIGMNT_PP_LDO_SLV):** Feed directly to SHIP or AFE: AFE Functional or Test Mode: Functional digital monitor port. **Power Well:** SUS
23:21	0x3 RW	**LDO reference voltage (I_LDOVREF_CFG_PP_LDO_SLV):** LDO reference voltage programmability bits, from common fuse. **Power Well:** SUS
20	0x0 RW	**LDO backup gm bias (I_LDOSTRTUP_PULSE_PP_LDO_SLV):** Backup option for gm-bias startup, from common fuse **Power Well:** SUS
19:18	0x1 RW	**LDO iref resistor program (I_LDOGMBIASR_CFG_PP_LDO_SLV):** LDO Iref block - resistor programmability, from common fuse. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
17:15	0x2 RW	**LDO soft start tstep (I_LDOSFTSTART_TSTEP_CFG_PP_LDO_SLV):** LDO soft start timer configuration used to select different clock period for soft-start, from common fuse. **Power Well:** SUS
14	0x0 RW	**LDO adaptive biasing (I_LDOADAPTBIAS_SELB_PP_LDO_SLV):** To enable/disable adaptive biasing scheme, by default adaptive biasing scheme is ON (active low). Common fuse. **Power Well:** SUS
13	0x0 RW	**LDO trim override select (I_LDOTRIM_OVERRIDE_SEL_PP_LDO_SLV):** Signal from unique fuse to select the LDO trim override option **Power Well:** SUS
12:7	0x1f RW	**LDO trim override (I_LDOTRIM_OVERRIDE_PP_LDO_SLV):** Inputs from unique fuse to override the FSM calibration values, In master-slave config, master and slaves LDOs need unique signals. **Power Well:** SUS
6	0x0 RW	**LDO soft start vstep (I_LDOSFTSTART_VSTEP_CFG_PP_LDO_SLV):** LDO soft start timer configuration used to select different voltage step in soft-start, from unique fuse. **Power Well:** SUS
5:0	0x0 RW	**LDO spare (I_LDOSPARE_PP_LDO_SLV):** spare digital inputs, 16 CRI used, 7 unique fuse used, 1 left, 7 common fuse used, 9 left (common fuse (10:2), unique fuse (1),) **Power Well:** SUS

7.15 USB 3.0 I/O Configuration Registers

7.15.1 USB 3.0 TX_REGS_IO Address Map

This section contains the summary of I/O Registers for controlling the swing and de-emphasis for USB 3.0 interface.

Note: The Tx Register Bits listed below are the same for all 4 lanes [3:0] are same but the address are different. Here are the addresses for each lane:

Registers Bits	Port ID	Lane0	Lane1	Lane2	Lane3
omargin000	0x61	0x2088	0x2288	0x0088	0x0288
ow2tapgen2deemph3p5	0x61	0x2090	0x2290	0x0090	0x0290
ocalccont	0x61	0x2094	0x2294	0x0094	0x0294

Note: Please use IOSF-SB bus to access these register. The details are available in Section 25.1 in the *Braswell BIOS Writers Guide* (CDI/IBL document number 541233).

Table 7-51. Summary of USB 3.0 TX_Registers

Table 2.

ModPhy Register Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8–Bh	4	"TX_DWORD2 (tx_dword2)—Offset 8h" on page 3315	5580983Ah
10–13h	4	"TX_DWORD4 (tx_dword4)—Offset 10h" on page 3316	2B404D55h
14–17h	4	"TX_DWORD5 (tx_dword5)—Offset 14h" on page 3316	00008000h

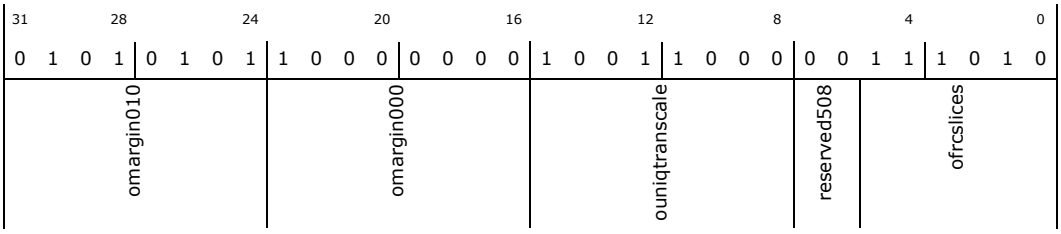
7.15.2 TX_DWORD2 (tx_dword2)—Offset 8h

Access Method

Type: I/O Register (Size: 32 bits)

Offset: 8h

Default: 5580983Ah



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x55 RW	Reserved
23:16	0x80 RW	**omargin000:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x98 RW	Reserved
7:6	0x0 RO	Reserved
5:0	0x3a RW	Reserved

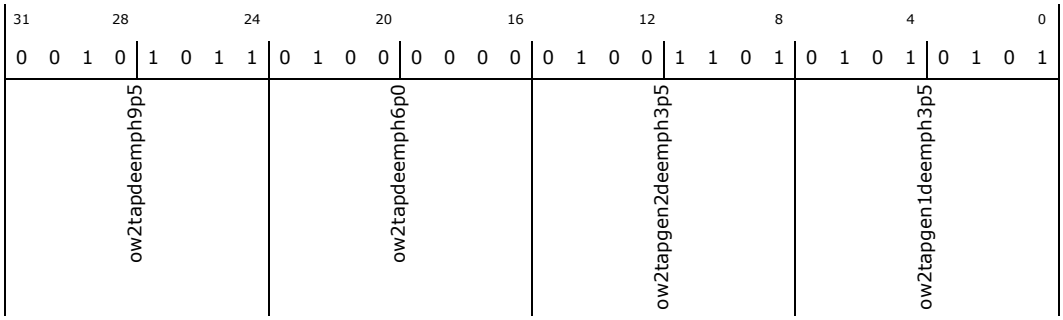
7.15.3 TX_DWORD4 (tx_dword4)—Offset 10h

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: 10h

Default: 2B404D55h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x2b RW	Reserved
23:16	0x40 RW	Reserved
15:8	0x4d RW	**ow2tapgen2deemph3p5:** Independent control for de-emphasis based on GEN1 rate protocols as factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally should be set at 3.5 dB de-emphasis.
7:0	0x55 RW	Reserved

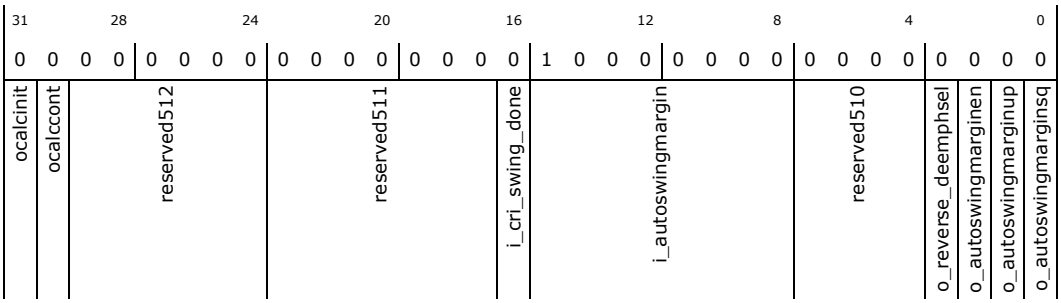
7.15.4 TX_DWORD5 (tx_dword5)—Offset 14h

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: 14h

Default: 00008000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	Reserved
30	0x0 RW	**ocalccont:** initiate calculation of swing-control circuit. While this signal is '1' the calculation is being done consecutively
29:24	0x0 RO	Reserved
23:17	0x0 RO	Reserved
16	X RO/V	Reserved
15:8	0x80 RO/V	Reserved
7:4	0x0 RO	Reserved
3	0x0 RW	Reserved
2	0x0 RW	Reserved
1	0x0 RW	Reserved
0	0x0 RW	Reserved

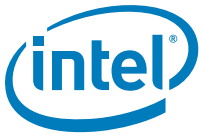
8 Low Power Engine (LPE) for Audio (I2S) Registers

8.1 LPE DMA 0 Memory Mapped I/O Registers

Table 52. Summary of DMA 0 Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_SAR_type (SAR0)—Offset 0h" on page 3323	00000000h
8–Bh	4	"reg_DAR_type (DAR0)—Offset 8h" on page 3324	00000000h
10–13h	4	"reg_LLP_type (LLP0)—Offset 10h" on page 3325	00000000h
18–1Bh	4	"reg_CTL_LO_type (CTL_LO0)—Offset 18h" on page 3325	00000000h
1C–1Fh	4	"reg_CTL_HI_type (CTL_HI0)—Offset 1Ch" on page 3327	00000000h
20–23h	4	"reg_SSTAT_type (SSTAT0)—Offset 20h" on page 3329	00000000h
28–2Bh	4	"reg_DSTAT_type (DSTAT0)—Offset 28h" on page 3329	00000000h
30–33h	4	"reg_SSTATAR_type (SSTATAR0)—Offset 30h" on page 3330	00000000h
38–3Bh	4	"reg_DSTATAR_type (DSTATAR0)—Offset 38h" on page 3330	00000000h
40–43h	4	"reg_CFG_LO_type (CFG_LO0)—Offset 40h" on page 3331	00000203h
44–47h	4	"reg_CFG_HI_type (CFG_HI0)—Offset 44h" on page 3333	00000000h
48–4Bh	4	"reg_SGR_type (SGR0)—Offset 48h" on page 3334	00000000h
50–53h	4	"reg_DSR_type (DSR0)—Offset 50h" on page 3335	00000000h
58–5Bh	4	"reg_SAR_type (SAR1)—Offset 58h" on page 3335	00000000h
60–63h	4	"reg_DAR_type (DAR1)—Offset 60h" on page 3336	00000000h
68–6Bh	4	"reg_LLP_type (LLP1)—Offset 68h" on page 3337	00000000h
70–73h	4	"reg_CTL_LO_type (CTL_LO1)—Offset 70h" on page 3338	00000000h
74–77h	4	"reg_CTL_HI_type (CTL_HI1)—Offset 74h" on page 3340	00000000h
78–7Bh	4	"reg_SSTAT_type (SSTAT1)—Offset 78h" on page 3341	00000000h
80–83h	4	"reg_DSTAT_type (DSTAT1)—Offset 80h" on page 3342	00000000h
88–8Bh	4	"reg_SSTATAR_type (SSTATAR1)—Offset 88h" on page 3343	00000000h
90–93h	4	"reg_DSTATAR_type (DSTATAR1)—Offset 90h" on page 3343	00000000h
98–9Bh	4	"reg_CFG_LO_type (CFG_LO1)—Offset 98h" on page 3344	00000203h
9C–9Fh	4	"reg_CFG_HI_type (CFG_HI1)—Offset 9Ch" on page 3346	00000000h
A0–A3h	4	"reg_SGR_type (SGR1)—Offset A0h" on page 3347	00000000h
A8–ABh	4	"reg_DSR_type (DSR1)—Offset A8h" on page 3348	00000000h
B0–B3h	4	"reg_SAR_type (SAR2)—Offset B0h" on page 3348	00000000h
B8–BBh	4	"reg_DAR_type (DAR2)—Offset B8h" on page 3349	00000000h
C0–C3h	4	"reg_LLP_type (LLP2)—Offset C0h" on page 3350	00000000h



Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
C8–CBh	4	"reg_CTL_LO_type (CTL_LO2)—Offset C8h" on page 3351	00000000h
CC–CFh	4	"reg_CTL_HI_type (CTL_HI2)—Offset CCh" on page 3353	00000000h
D0–D3h	4	"reg_SSTAT_type (SSTAT2)—Offset D0h" on page 3354	00000000h
D8–DBh	4	"reg_DSTAT_type (DSTAT2)—Offset D8h" on page 3355	00000000h
E0–E3h	4	"reg_SSTATAR_type (SSTATAR2)—Offset E0h" on page 3356	00000000h
E8–EBh	4	"reg_DSTATAR_type (DSTATAR2)—Offset E8h" on page 3356	00000000h
F0–F3h	4	"reg_CFG_LO_type (CFG_LO2)—Offset F0h" on page 3357	00000203h
F4–F7h	4	"reg_CFG_HI_type (CFG_HI2)—Offset F4h" on page 3359	00000000h
F8–FBh	4	"reg_SGR_type (SGR2)—Offset F8h" on page 3360	00000000h
100–103h	4	"reg_DSR_type (DSR2)—Offset 100h" on page 3361	00000000h
108–10Bh	4	"reg_SAR_type (SAR3)—Offset 108h" on page 3361	00000000h
110–113h	4	"reg_DAR_type (DAR3)—Offset 110h" on page 3362	00000000h
118–11Bh	4	"reg_LLP_type (LLP3)—Offset 118h" on page 3363	00000000h
120–123h	4	"reg_CTL_LO_type (CTL_LO3)—Offset 120h" on page 3364	00000000h
124–127h	4	"reg_CTL_HI_type (CTL_HI3)—Offset 124h" on page 3366	00000000h
128–12Bh	4	"reg_SSTAT_type (SSTAT3)—Offset 128h" on page 3367	00000000h
130–133h	4	"reg_DSTAT_type (DSTAT3)—Offset 130h" on page 3368	00000000h
138–13Bh	4	"reg_SSTATAR_type (SSTATAR3)—Offset 138h" on page 3369	00000000h
140–143h	4	"reg_DSTATAR_type (DSTATAR3)—Offset 140h" on page 3369	00000000h
148–14Bh	4	"reg_CFG_LO_type (CFG_LO3)—Offset 148h" on page 3370	00000203h
14C–14Fh	4	"reg_CFG_HI_type (CFG_HI3)—Offset 14Ch" on page 3372	00000000h
150–153h	4	"reg_SGR_type (SGR3)—Offset 150h" on page 3373	00000000h
158–15Bh	4	"reg_DSR_type (DSR3)—Offset 158h" on page 3374	00000000h
160–163h	4	"reg_SAR_type (SAR4)—Offset 160h" on page 3374	00000000h
168–16Bh	4	"reg_DAR_type (DAR4)—Offset 168h" on page 3375	00000000h
170–173h	4	"reg_LLP_type (LLP4)—Offset 170h" on page 3376	00000000h
178–17Bh	4	"reg_CTL_LO_type (CTL_LO4)—Offset 178h" on page 3377	00000000h
17C–17Fh	4	"reg_CTL_HI_type (CTL_HI4)—Offset 17Ch" on page 3379	00000000h
180–183h	4	"reg_SSTAT_type (SSTAT4)—Offset 180h" on page 3380	00000000h
188–18Bh	4	"reg_DSTAT_type (DSTAT4)—Offset 188h" on page 3381	00000000h
190–193h	4	"reg_SSTATAR_type (SSTATAR4)—Offset 190h" on page 3382	00000000h
198–19Bh	4	"reg_DSTATAR_type (DSTATAR4)—Offset 198h" on page 3382	00000000h
1A0–1A3h	4	"reg_CFG_LO_type (CFG_LO4)—Offset 1A0h" on page 3383	00000203h
1A4–1A7h	4	"reg_CFG_HI_type (CFG_HI4)—Offset 1A4h" on page 3385	00000000h
1A8–1ABh	4	"reg_SGR_type (SGR4)—Offset 1A8h" on page 3386	00000000h
1B0–1B3h	4	"reg_DSR_type (DSR4)—Offset 1B0h" on page 3387	00000000h
1B8–1BBh	4	"reg_SAR_type (SAR5)—Offset 1B8h" on page 3387	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1C0–1C3h	4	"reg_DAR_type (DAR5)—Offset 1C0h" on page 3388	00000000h
1C8–1CBh	4	"reg_LLP_type (LLP5)—Offset 1C8h" on page 3389	00000000h
1D0–1D3h	4	"reg_CTL_LO_type (CTL_LO5)—Offset 1D0h" on page 3390	00000000h
1D4–1D7h	4	"reg_CTL_HI_type (CTL_HI5)—Offset 1D4h" on page 3392	00000000h
1D8–1DBh	4	"reg_SSTAT_type (SSTAT5)—Offset 1D8h" on page 3393	00000000h
1E0–1E3h	4	"reg_DSTAT_type (DSTAT5)—Offset 1E0h" on page 3394	00000000h
1E8–1EBh	4	"reg_SSTATAR_type (SSTATAR5)—Offset 1E8h" on page 3395	00000000h
1F0–1F3h	4	"reg_DSTATAR_type (DSTATAR5)—Offset 1F0h" on page 3395	00000000h
1F8–1FBh	4	"reg_CFG_LO_type (CFG_LO5)—Offset 1F8h" on page 3396	00000203h
1FC–1FFh	4	"reg_CFG_HI_type (CFG_HI5)—Offset 1FCh" on page 3398	00000000h
200–203h	4	"reg_SGR_type (SGR5)—Offset 200h" on page 3399	00000000h
208–20Bh	4	"reg_DSR_type (DSR5)—Offset 208h" on page 3400	00000000h
210–213h	4	"reg_SAR_type (SAR6)—Offset 210h" on page 3400	00000000h
218–21Bh	4	"reg_DAR_type (DAR6)—Offset 218h" on page 3401	00000000h
220–223h	4	"reg_LLP_type (LLP6)—Offset 220h" on page 3402	00000000h
228–22Bh	4	"reg_CTL_LO_type (CTL_LO6)—Offset 228h" on page 3403	00000000h
22C–22Fh	4	"reg_CTL_HI_type (CTL_HI6)—Offset 22Ch" on page 3405	00000000h
230–233h	4	"reg_SSTAT_type (SSTAT6)—Offset 230h" on page 3406	00000000h
238–23Bh	4	"reg_DSTAT_type (DSTAT6)—Offset 238h" on page 3407	00000000h
240–243h	4	"reg_SSTATAR_type (SSTATAR6)—Offset 240h" on page 3408	00000000h
248–24Bh	4	"reg_DSTATAR_type (DSTATAR6)—Offset 248h" on page 3408	00000000h
250–253h	4	"reg_CFG_LO_type (CFG_LO6)—Offset 250h" on page 3409	00000203h
254–257h	4	"reg_CFG_HI_type (CFG_HI6)—Offset 254h" on page 3411	00000000h
258–25Bh	4	"reg_SGR_type (SGR6)—Offset 258h" on page 3412	00000000h

8.1.1 reg_SAR_type (SAR0)—Offset 0h

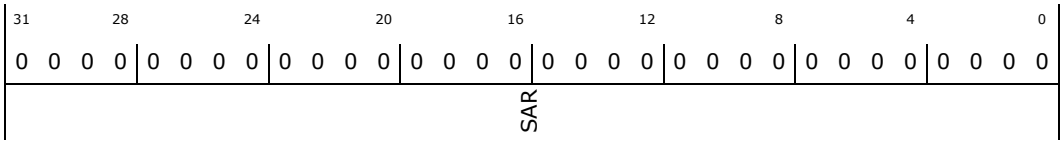
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.2 reg_DAR_type (DAR0)—Offset 8h

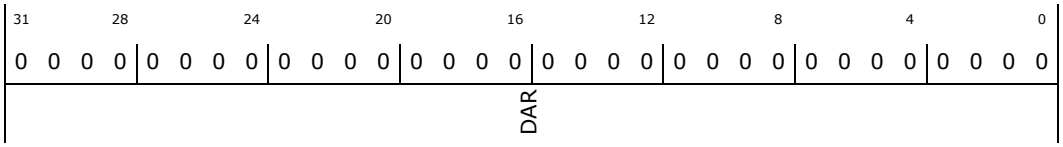
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

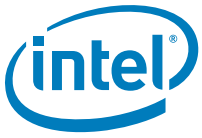
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported



8.1.3 reg_LLP_type (LLP0)—Offset 10h

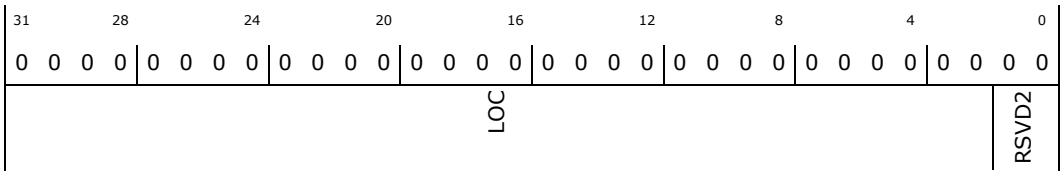
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

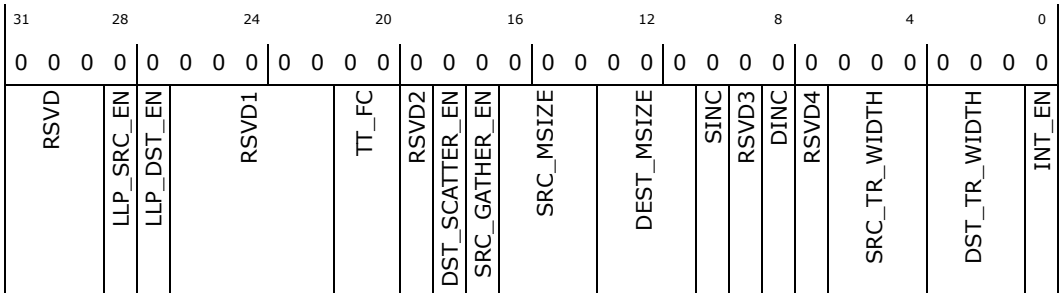
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

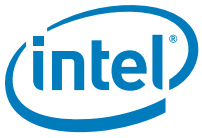
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.



Bit Range	Default & Access	Field Name (ID): Description
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.5 reg_CTL_HI_type (CTL_HI0)—Offset 1Ch

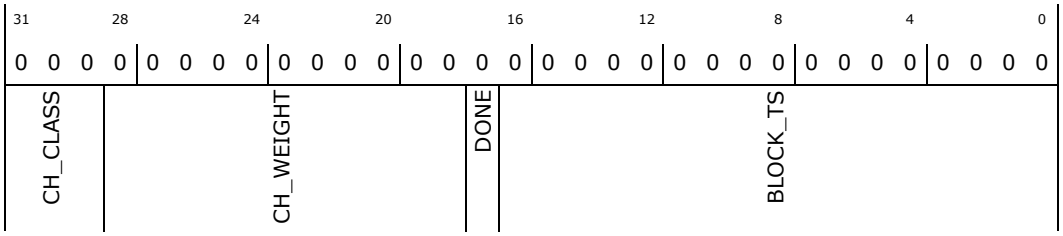
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.6 reg_SSTAT_type (SSTAT0)—Offset 20h

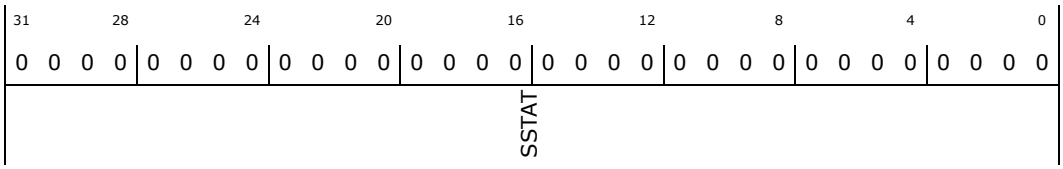
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 20h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.7 reg_DSTAT_type (DSTAT0)—Offset 28h

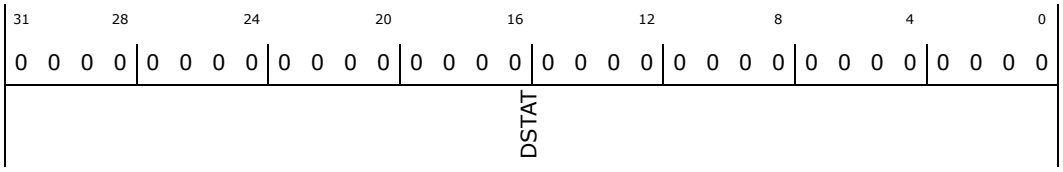
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

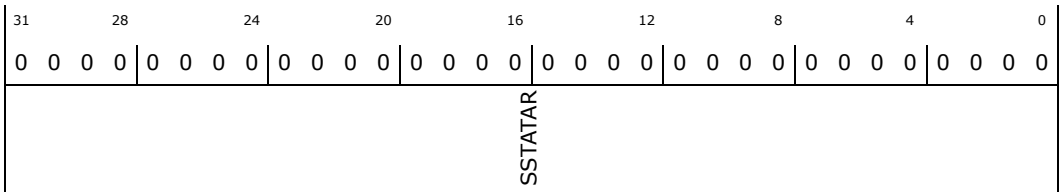
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

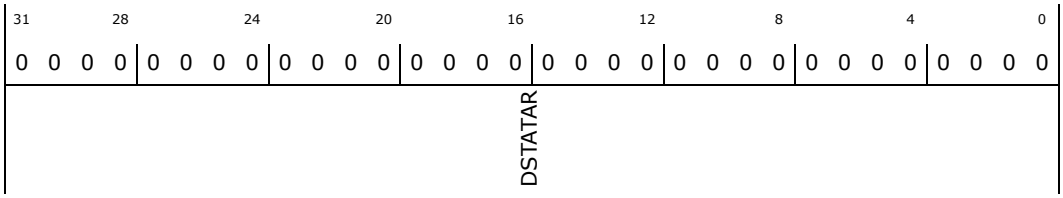
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

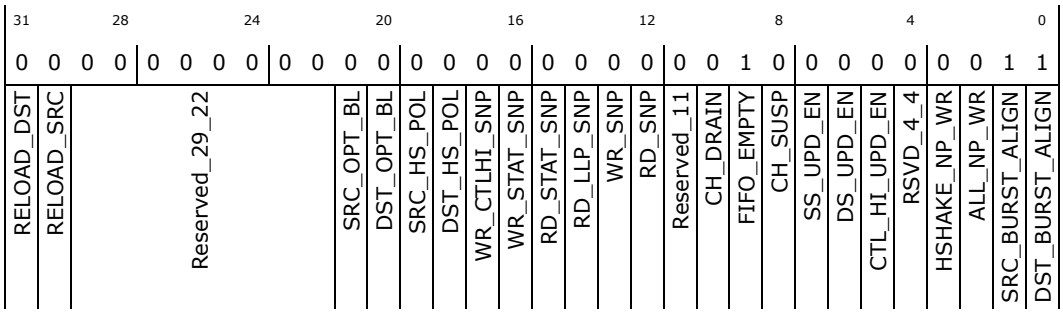
This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 40h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.11 reg_CFG_HI_type (CFG_HI0)—Offset 44h

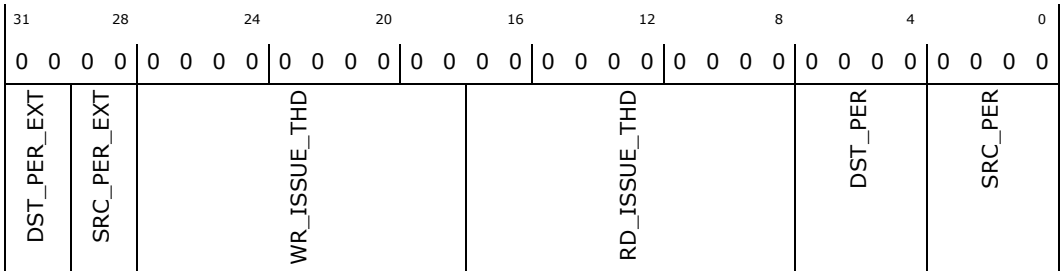
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 44h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.

Bit Range	Default & Access	Field Name (ID): Description
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

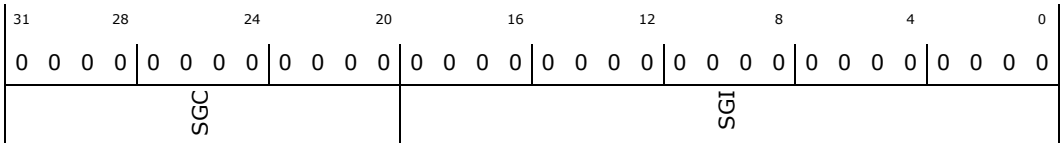
8.1.12 reg_SGR_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **Offset:** [lpe_bridge.BAR + 98000h] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.13 reg_DSR_type (DSR0)—Offset 50h

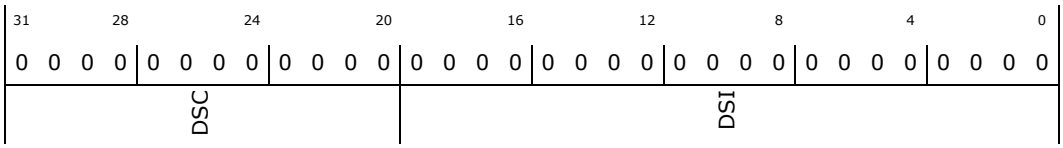
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 50h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.14 reg_SAR_type (SAR1)—Offset 58h

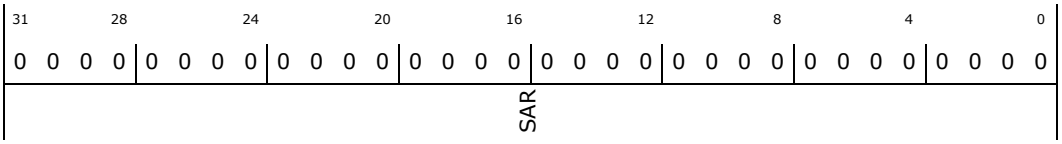
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 58h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.15 reg_DAR_type (DAR1)—Offset 60h

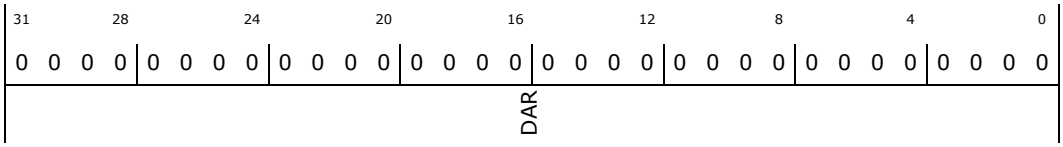
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 60h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.16 reg_LLP_type (LLP1)—Offset 68h

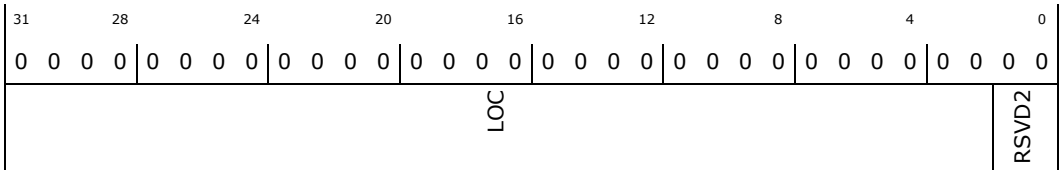
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 68h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.17 reg_CTL_LO_type (CTL_LO1)—Offset 70h

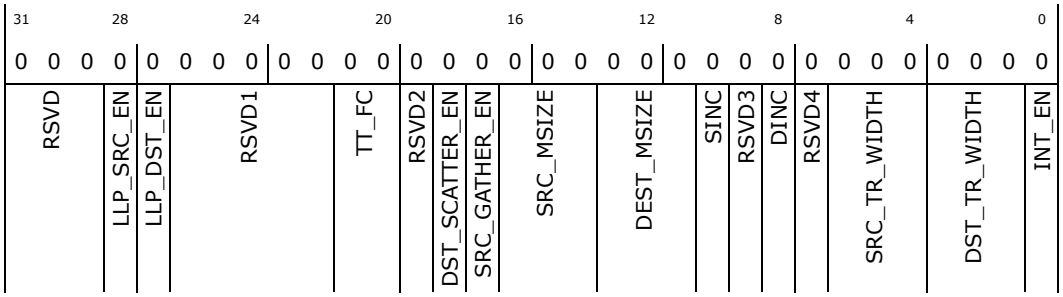
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 70h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)

Bit Range	Default & Access	Field Name (ID): Description
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.18 reg_CTL_HI_type (CTL_HI1)—Offset 74h

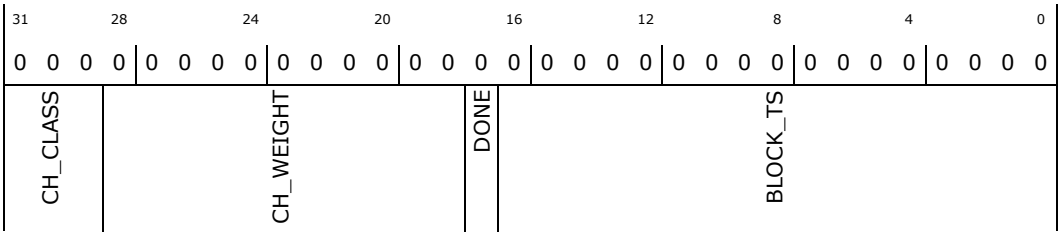
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

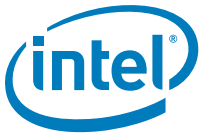
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.19 reg_SSTAT_type (SSTAT1)—Offset 78h

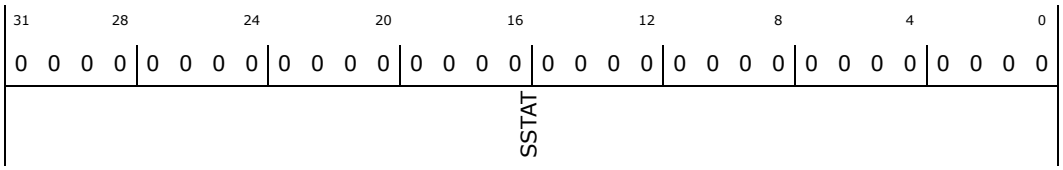
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.20 reg_DSTAT_type (DSTAT1)—Offset 80h

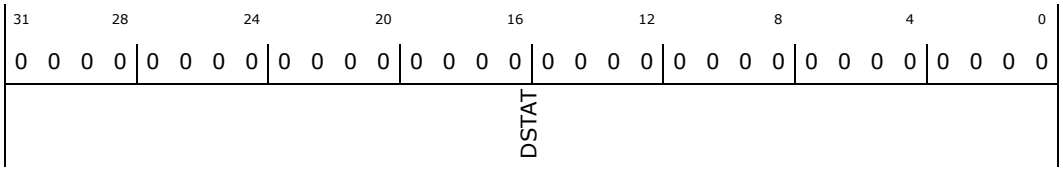
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 98000h] + 80h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.21 reg_SSTATAR_type (SSTATAR1)—Offset 88h

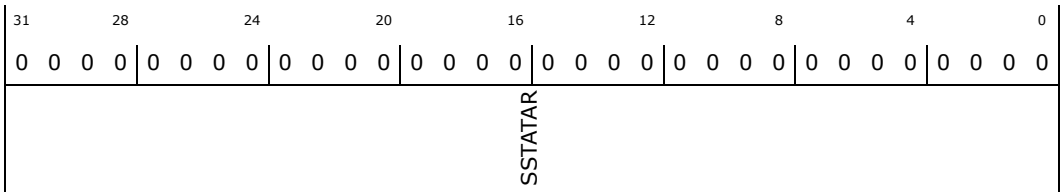
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 88h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.22 reg_DSTATAR_type (DSTATAR1)—Offset 90h

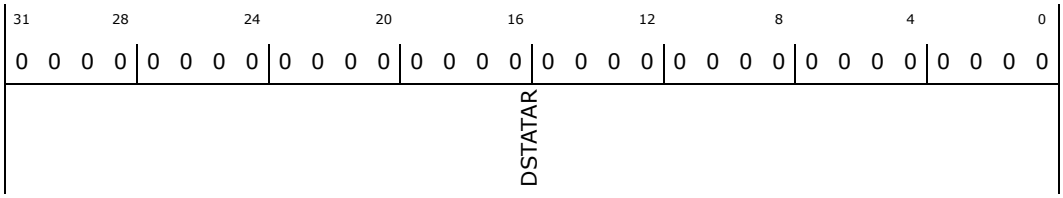
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 90h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.23 reg_CFG_LO_type (CFG_LO1)—Offset 98h

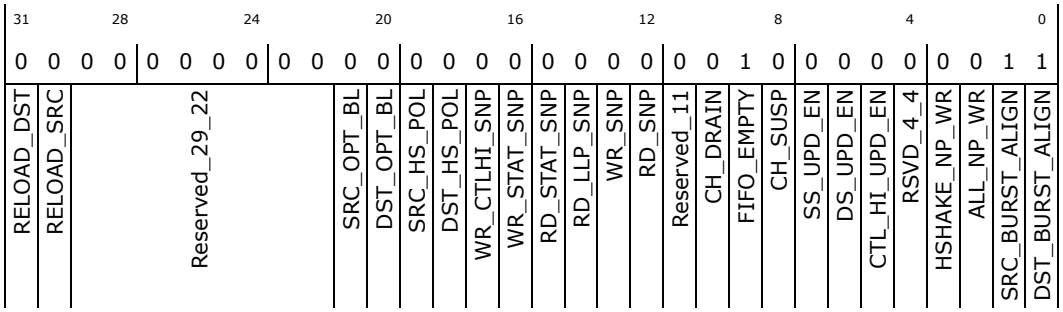
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 98h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.24 reg_CFG_HI_type (CFG_HI1)—Offset 9Ch

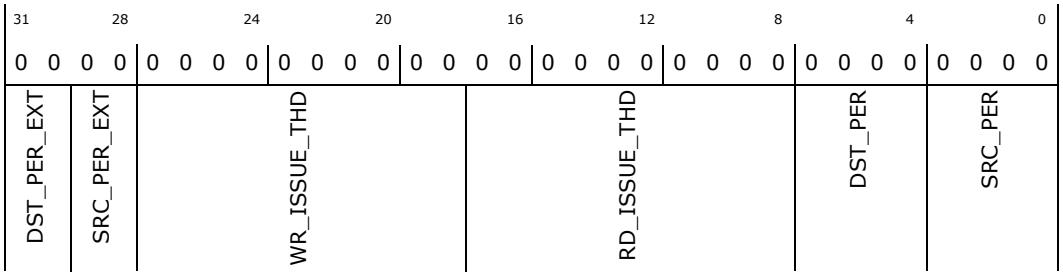
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

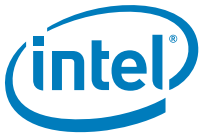
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 9Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.



Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.25 reg_SGR_type (SGR1)—Offset A0h

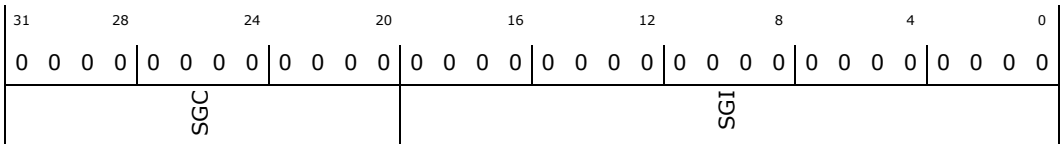
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.26 reg_DSR_type (DSR1)—Offset A8h

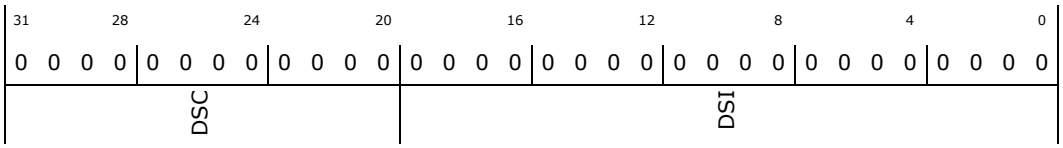
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.27 reg_SAR_type (SAR2)—Offset B0h

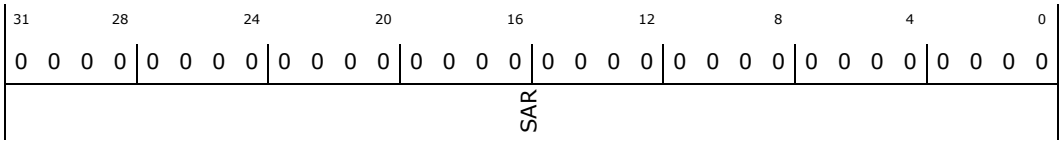
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.28 reg_DAR_type (DAR2)—Offset B8h

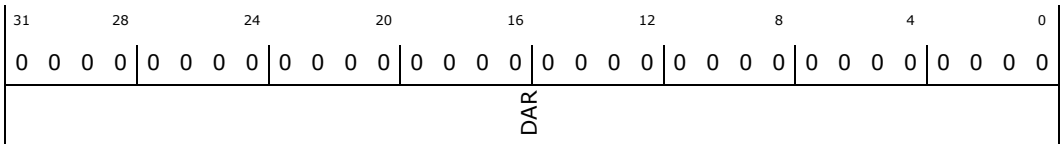
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.29 reg_LLP_type (LLP2)—Offset C0h

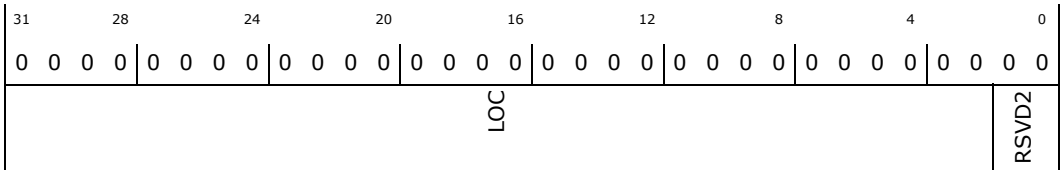
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

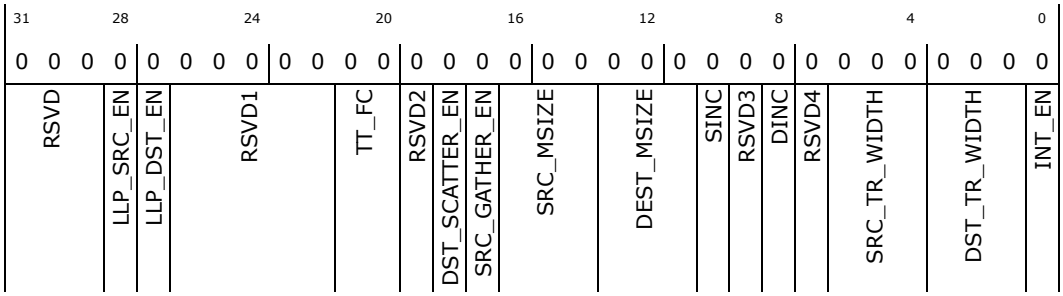
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.31 reg_CTL_HI_type (CTL_HI2)—Offset CCh

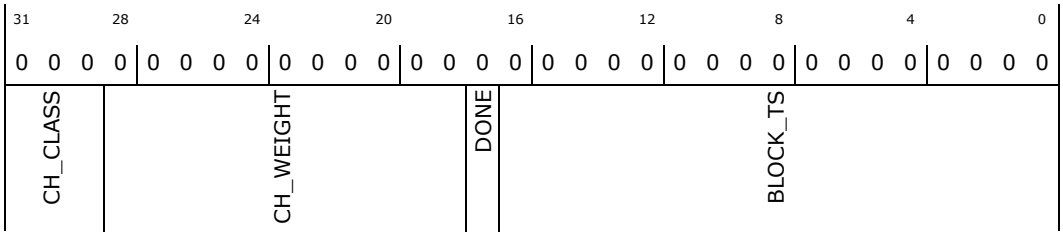
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + CCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.32 reg_SSTAT_type (SSTAT2)—Offset D0h

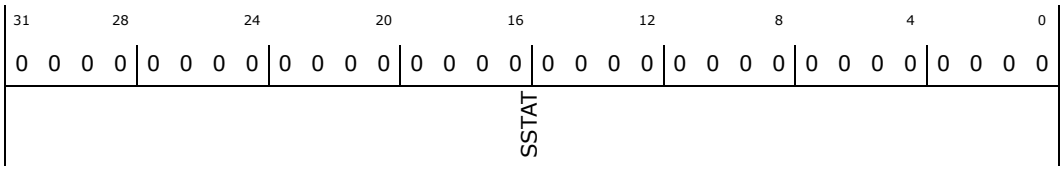
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.33 reg_DSTAT_type (DSTAT2)—Offset D8h

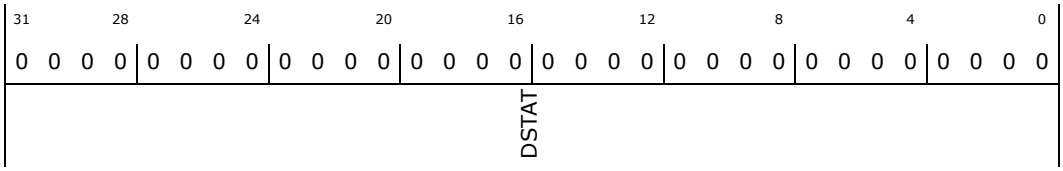
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.34 reg_SSTATAR_type (SSTATAR2)—Offset E0h

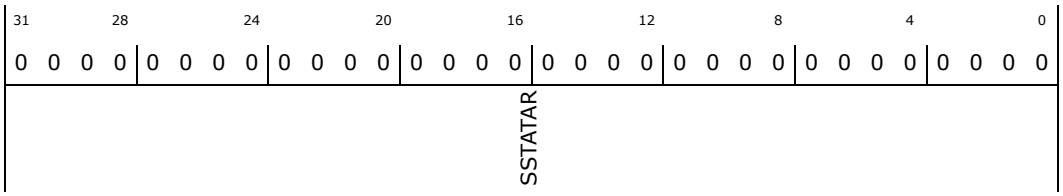
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.35 reg_DSTATAR_type (DSTATAR2)—Offset E8h

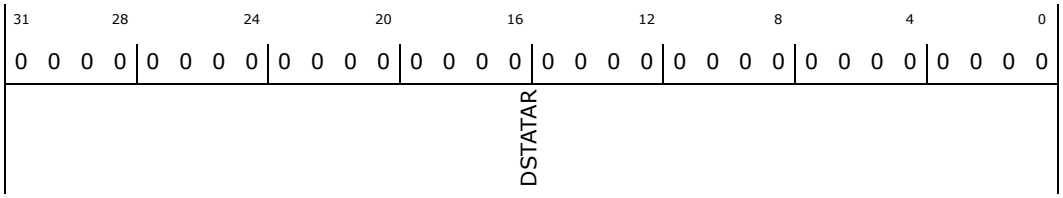
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.36 reg_CFG_LO_type (CFG_LO2)—Offset F0h

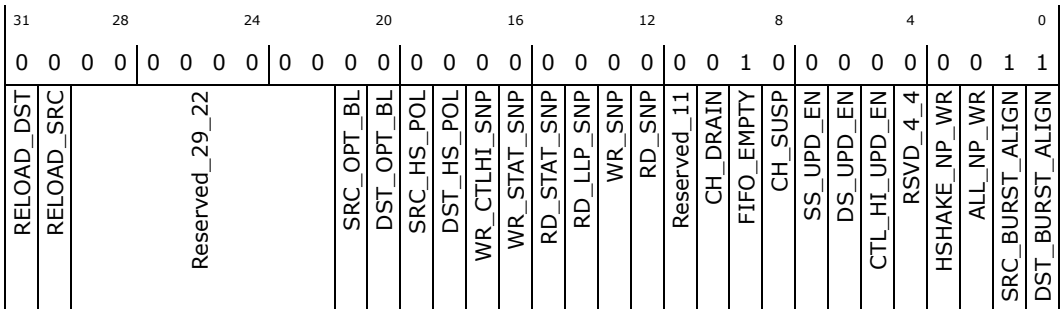
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + F0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.37 reg_CFG_HI_type (CFG_HI2)—Offset F4h

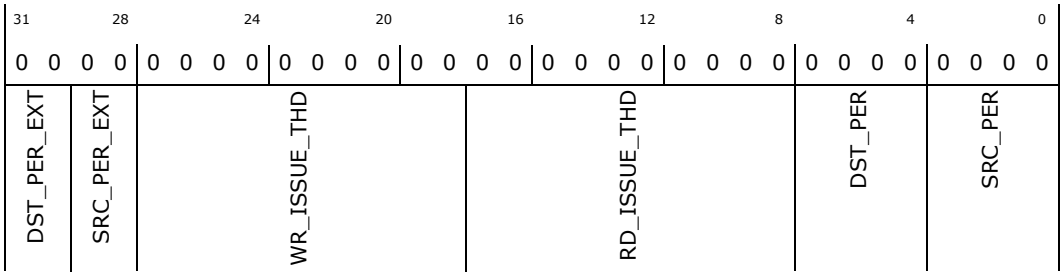
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + F4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.38 reg_SGR_type (SGR2)—Offset F8h

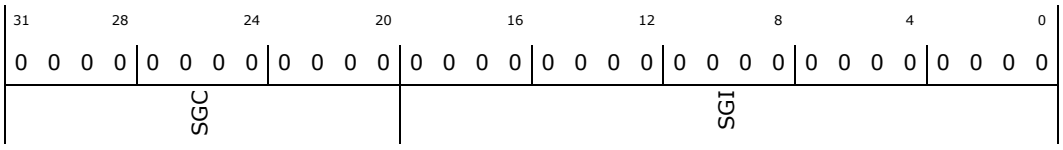
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + F8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.39 reg_DSR_type (DSR2)—Offset 100h

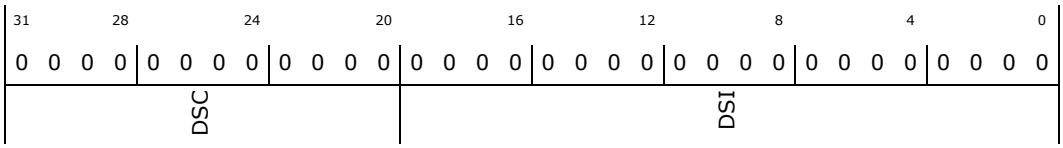
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 100h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.40 reg_SAR_type (SAR3)—Offset 108h

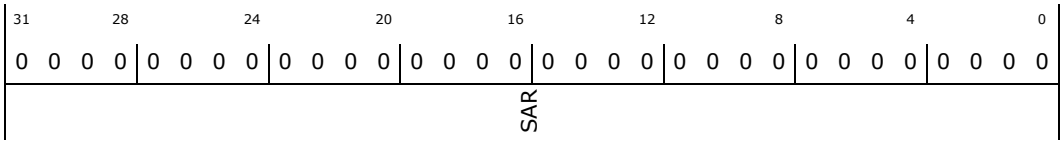
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 108h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.41 reg_DAR_type (DAR3)—Offset 110h

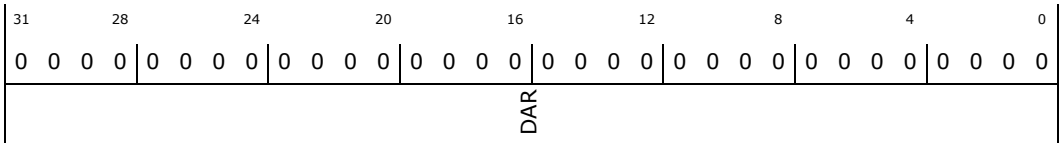
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

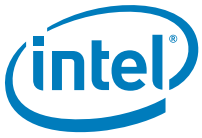
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 110h

Default: 00000000h





Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.42 reg_LLP_type (LLP3)—Offset 118h

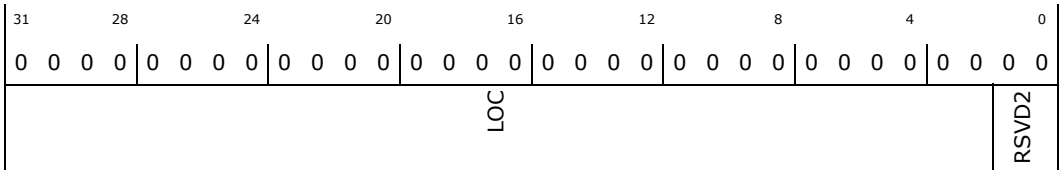
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 118h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.43 reg_CTL_LO_type (CTL_LO3)—Offset 120h

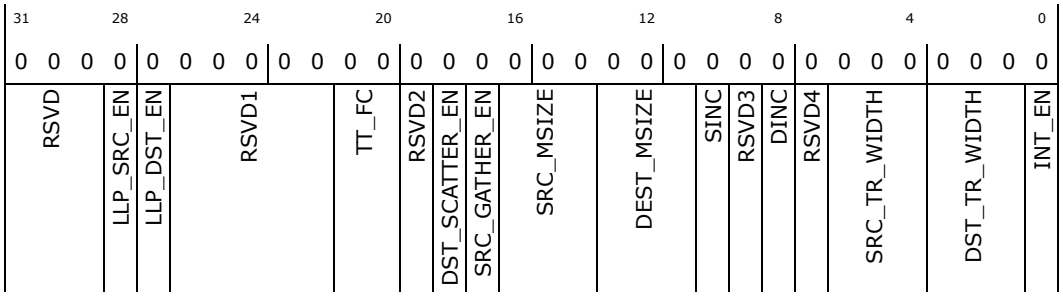
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 120h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.44 reg_CTL_HI_type (CTL_HI3)—Offset 124h

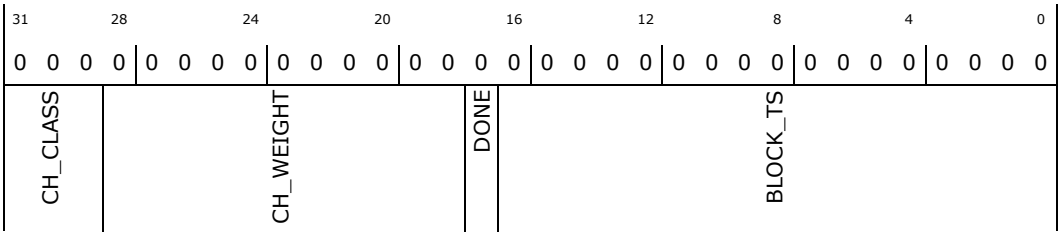
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

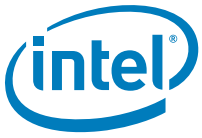
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 124h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.45 reg_SSTAT_type (SSTAT3)—Offset 128h

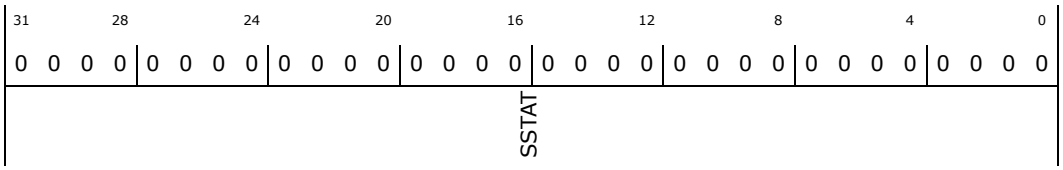
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 128h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.46 reg_DSTAT_type (DSTAT3)—Offset 130h

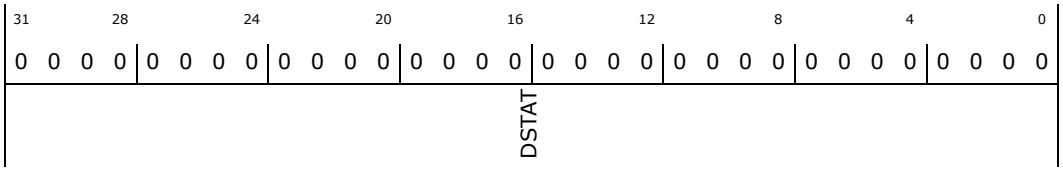
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 130h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.47 reg_SSTATAR_type (SSTATAR3)—Offset 138h

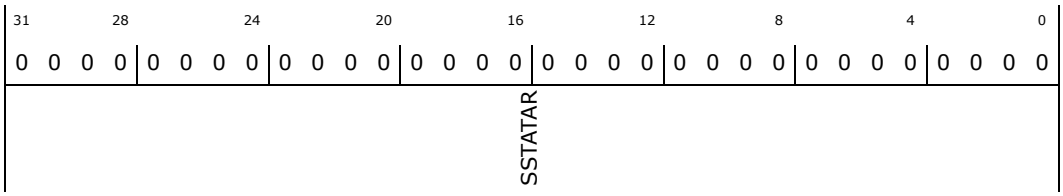
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 138h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.48 reg_DSTATAR_type (DSTATAR3)—Offset 140h

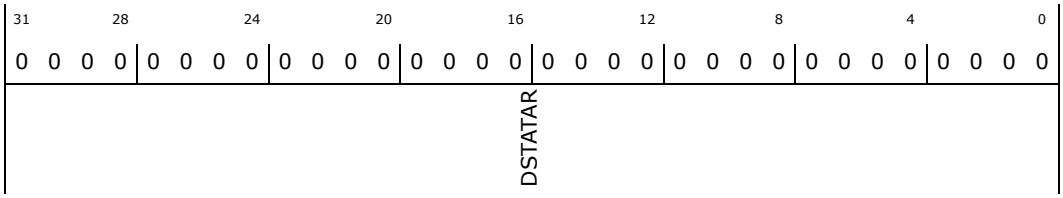
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 140h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.49 reg_CFG_LO_type (CFG_LO3)—Offset 148h

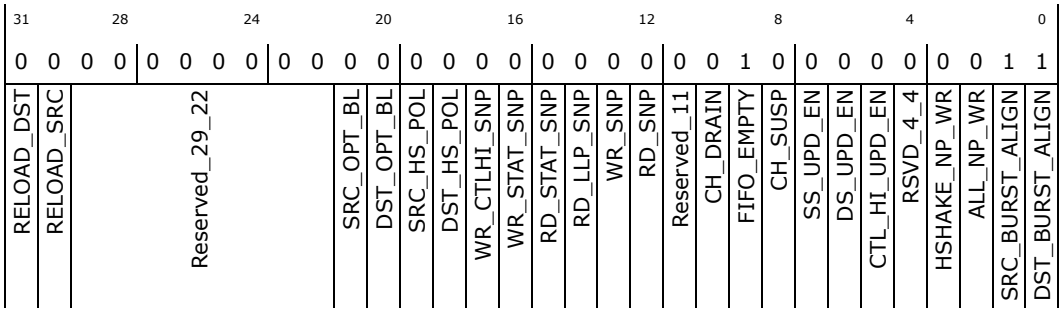
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 148h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.50 reg_CFG_HI_type (CFG_HI3)—Offset 14Ch

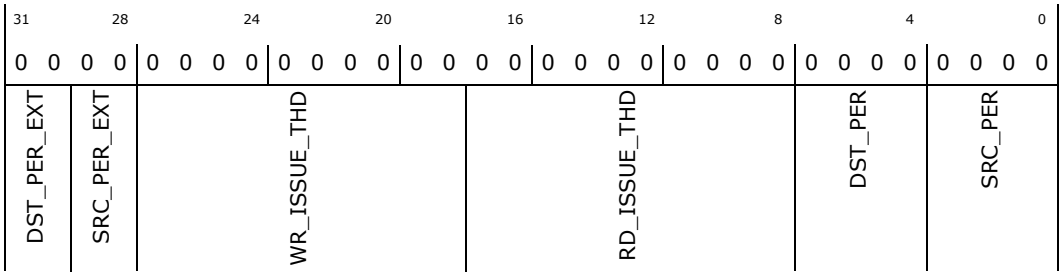
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 14Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.51 reg_SGR_type (SGR3)—Offset 150h

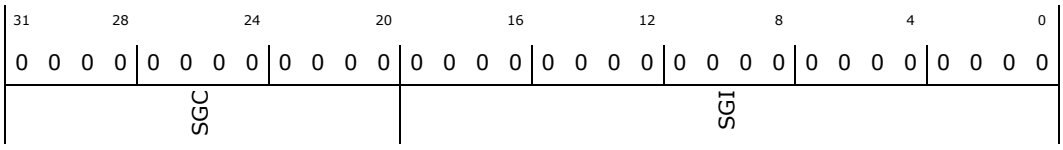
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 150h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.52 reg_DSR_type (DSR3)—Offset 158h

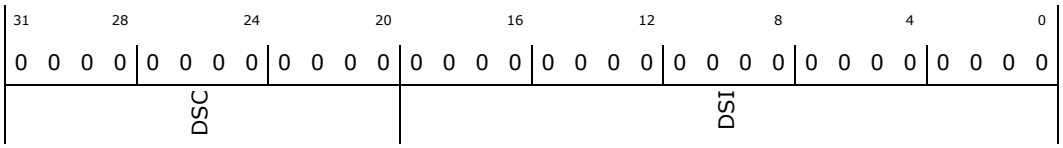
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 158h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.53 reg_SAR_type (SAR4)—Offset 160h

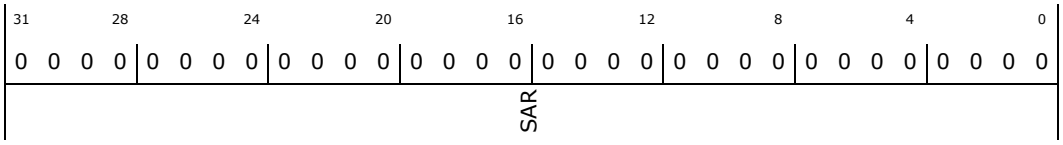
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 160h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.54 reg_DAR_type (DAR4)—Offset 168h

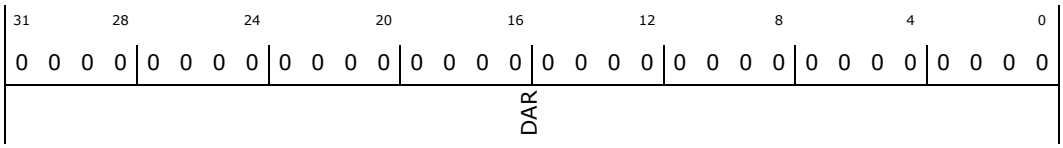
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 168h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.55 reg_LLP_type (LLP4)—Offset 170h

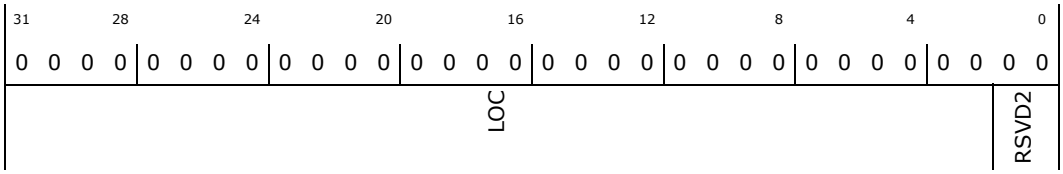
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 170h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

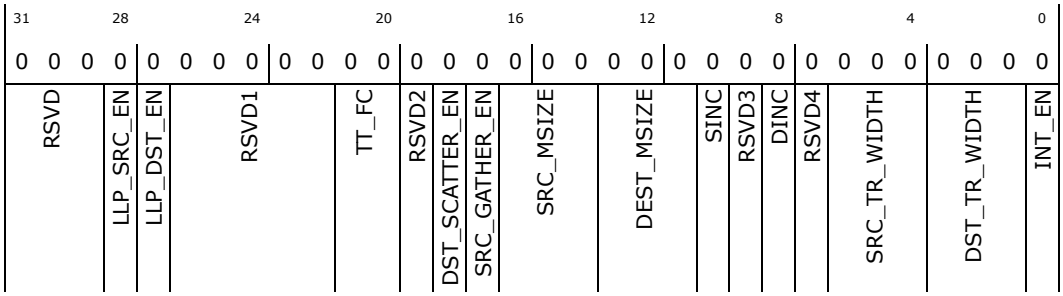
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 178h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.57 reg_CTL_HI_type (CTL_HI4)—Offset 17Ch

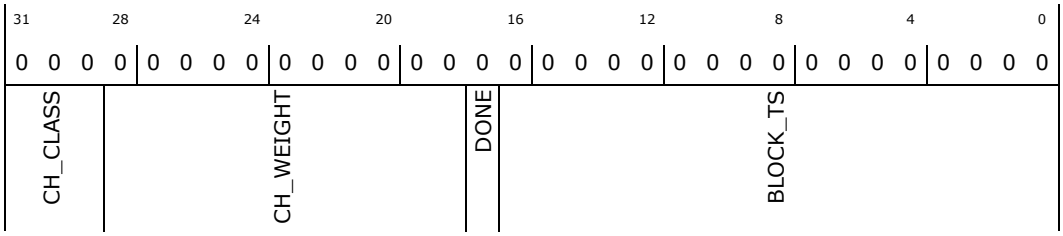
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 17Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.58 reg_SSTAT_type (SSTAT4)—Offset 180h

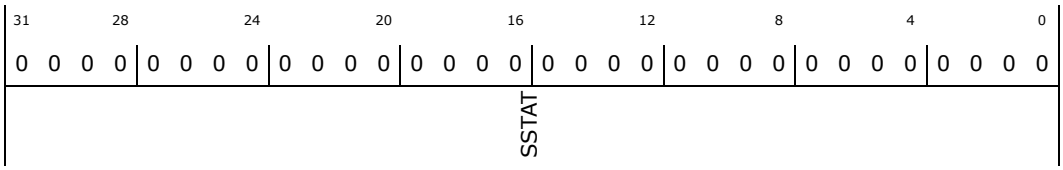
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 180h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.59 reg_DSTAT_type (DSTAT4)—Offset 188h

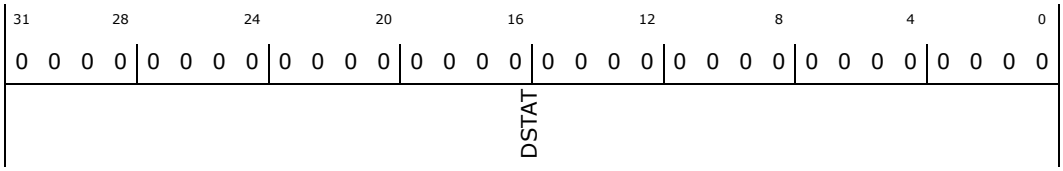
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 188h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.60 reg_SSTATAR_type (SSTATAR4)—Offset 190h

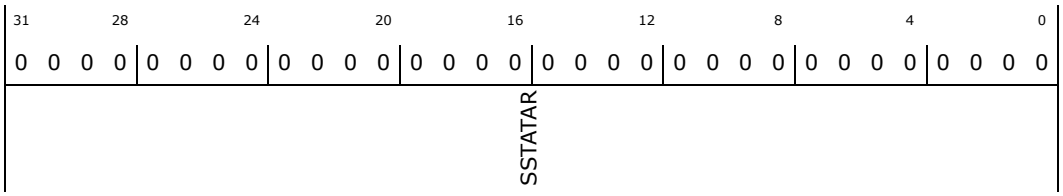
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 190h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.61 reg_DSTATAR_type (DSTATAR4)—Offset 198h

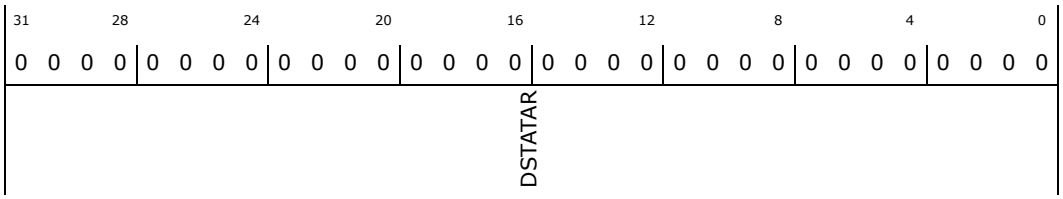
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 198h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.62 reg_CFG_LO_type (CFG_LO4)—Offset 1A0h

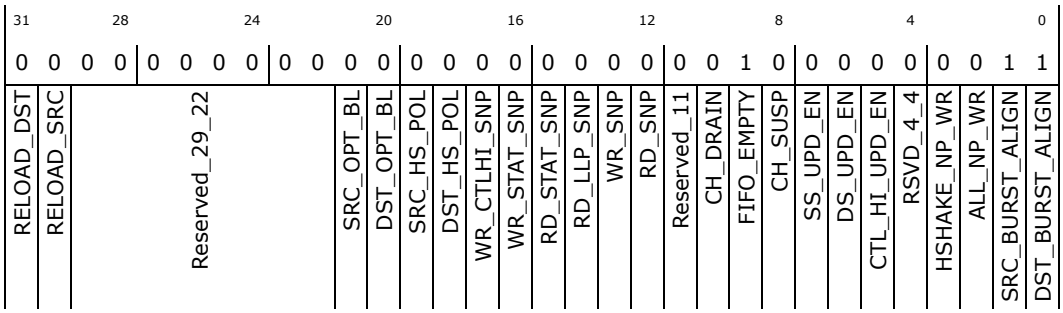
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1A0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.63 reg_CFG_HI_type (CFG_HI4)—Offset 1A4h

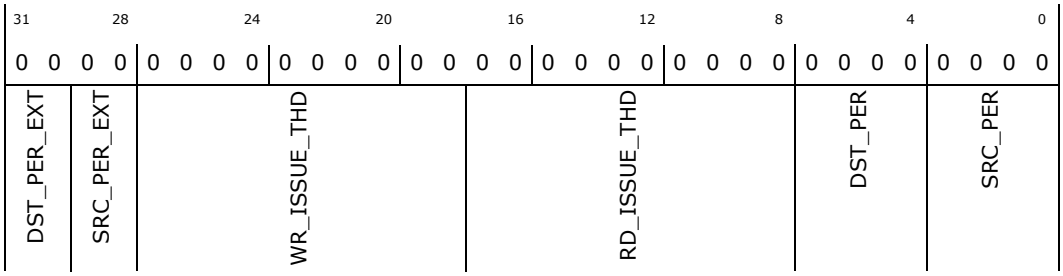
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1A4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.64 reg_SGR_type (SGR4)—Offset 1A8h

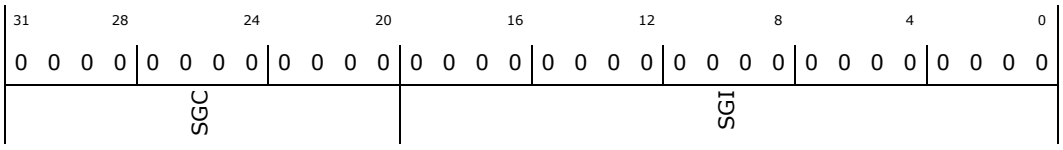
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.65 reg_DSR_type (DSR4)—Offset 1B0h

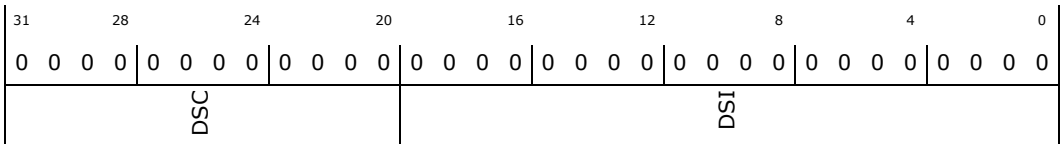
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.66 reg_SAR_type (SAR5)—Offset 1B8h

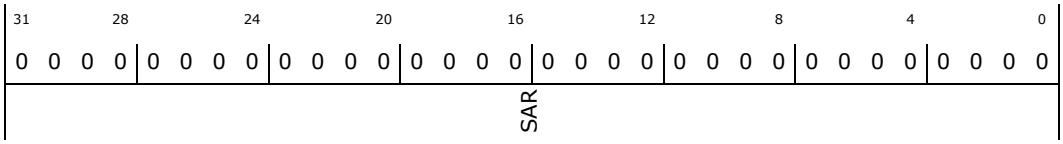
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.67 reg_DAR_type (DAR5)—Offset 1C0h

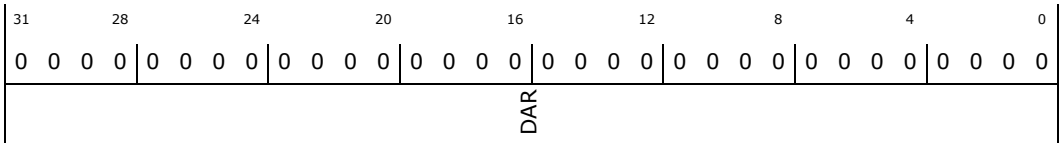
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

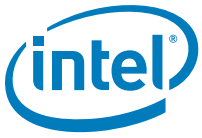
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1C0h

Default: 00000000h





Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.68 reg_LLP_type (LLP5)—Offset 1C8h

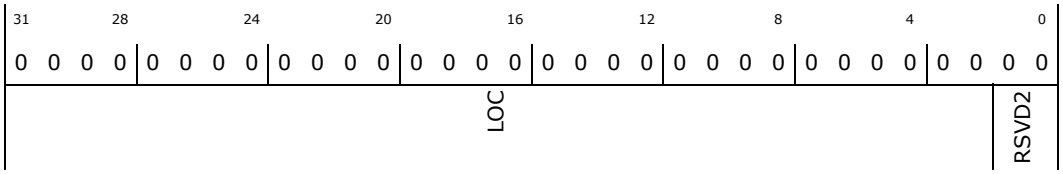
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.69 reg_CTL_LO_type (CTL_LO5)—Offset 1D0h

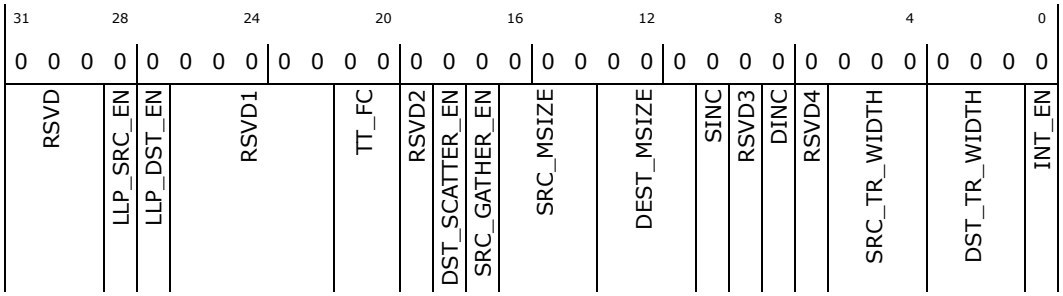
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.70 reg_CTL_HI_type (CTL_HI5)—Offset 1D4h

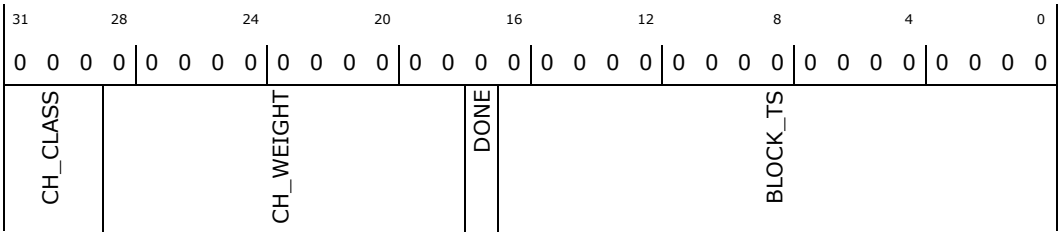
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

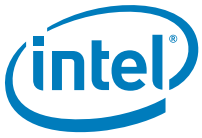
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1D4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.71 reg_SSTAT_type (SSTAT5)—Offset 1D8h

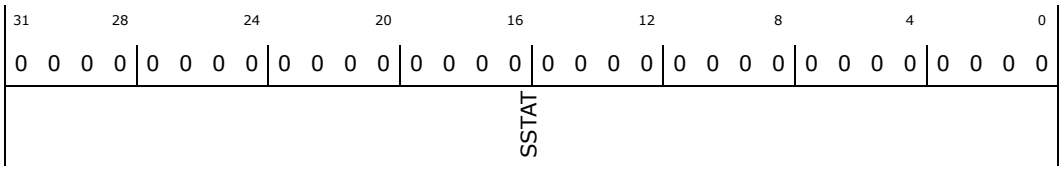
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.72 reg_DSTAT_type (DSTAT5)—Offset 1E0h

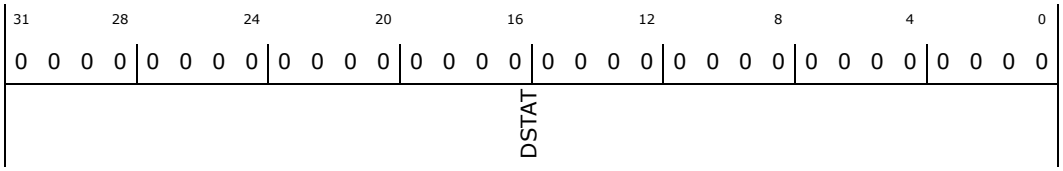
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.73 reg_SSTATAR_type (SSTATAR5)—Offset 1E8h

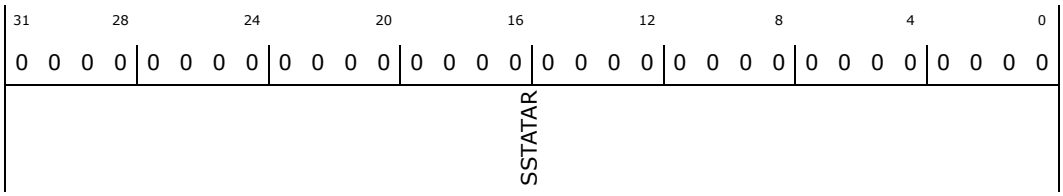
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.74 reg_DSTATAR_type (DSTATAR5)—Offset 1F0h

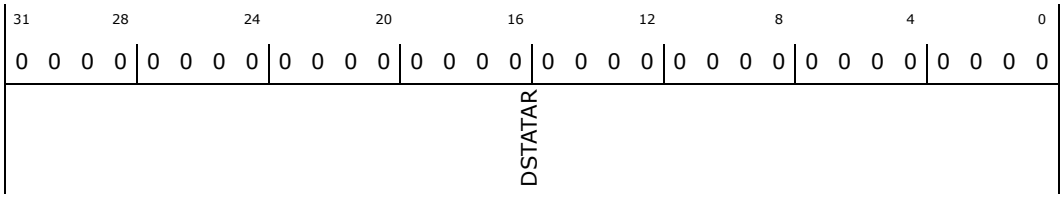
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1F0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.75 reg_CFG_LO_type (CFG_LO5)—Offset 1F8h

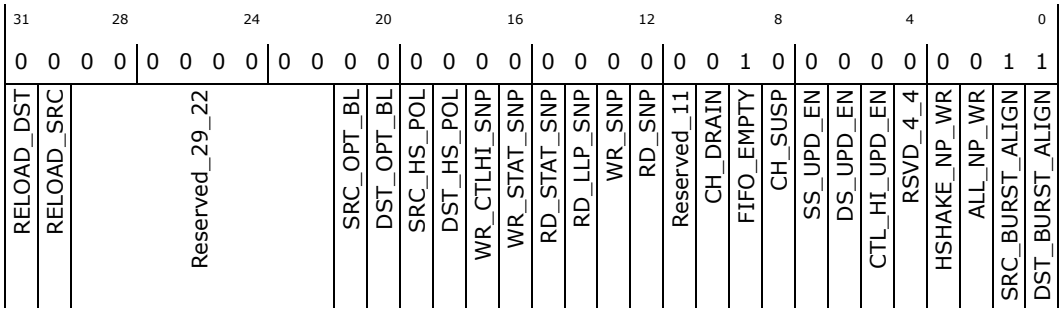
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

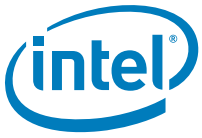
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1F8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values



Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.76 reg_CFG_HI_type (CFG_HI5)—Offset 1FCh

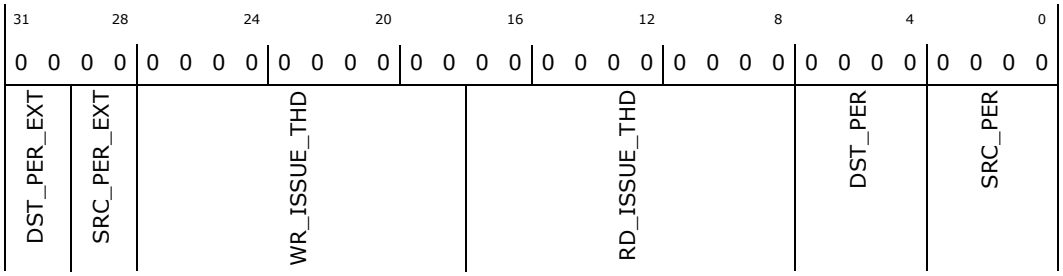
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 1FCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.77 reg_SGR_type (SGR5)—Offset 200h

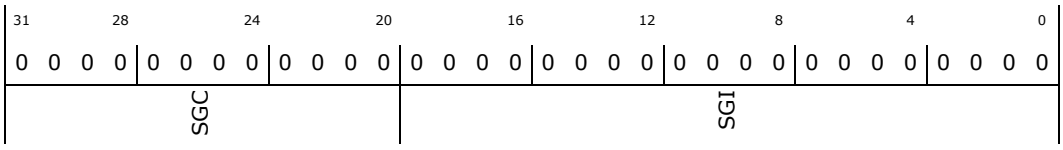
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 200h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.78 reg_DSR_type (DSR5)—Offset 208h

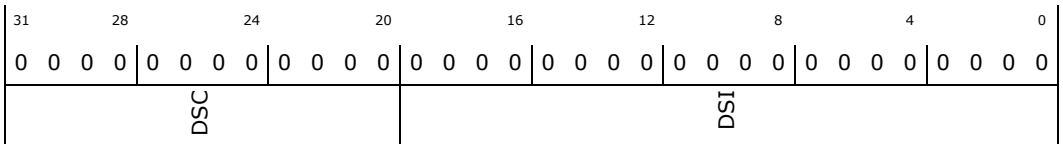
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 208h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.79 reg_SAR_type (SAR6)—Offset 210h

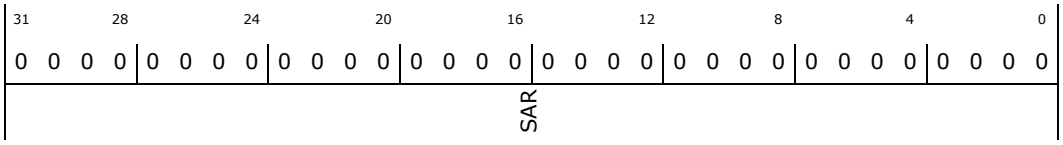
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 210h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.80 reg_DAR_type (DAR6)—Offset 218h

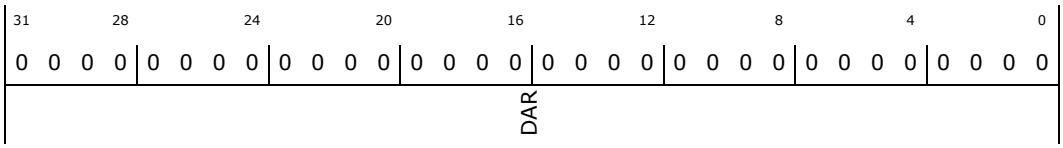
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 218h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.81 reg_LLP_type (LLP6)—Offset 220h

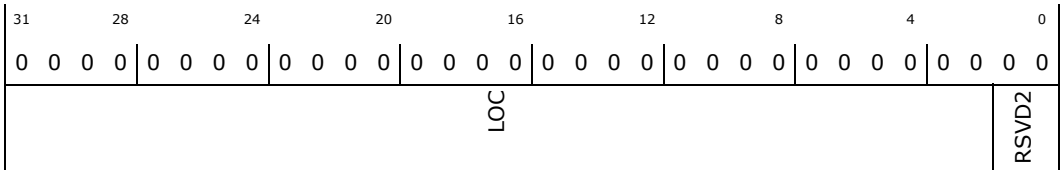
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 220h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.82 reg_CTL_LO_type (CTL_LO6)—Offset 228h

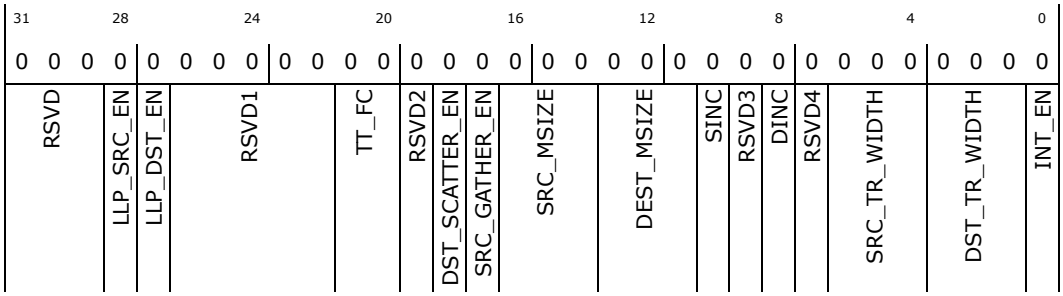
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 228h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.83 reg_CTL_HI_type (CTL_HI6)—Offset 22Ch

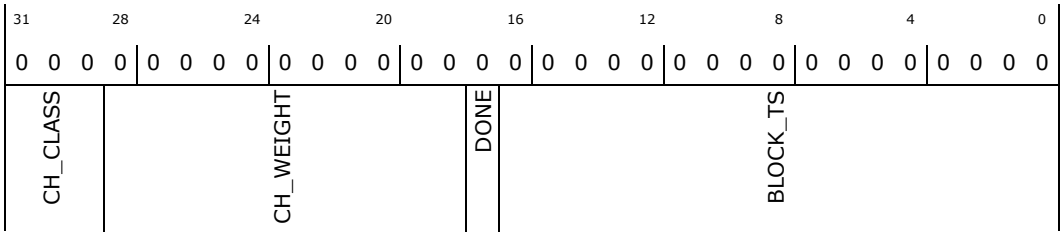
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 22Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.84 reg_SSTAT_type (SSTAT6)—Offset 230h

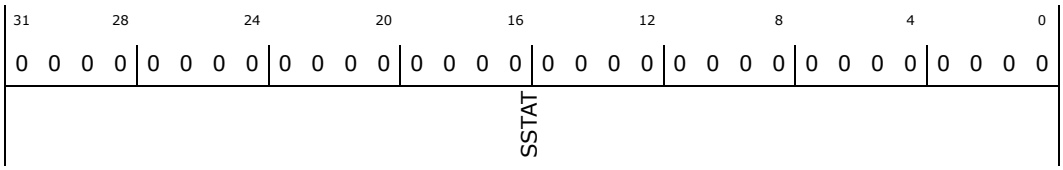
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 230h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.85 reg_DSTAT_type (DSTAT6)—Offset 238h

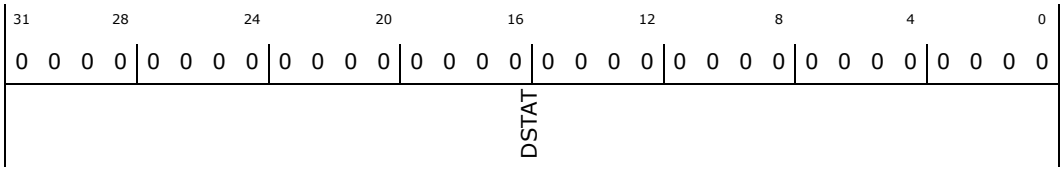
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 238h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.86 reg_SSTATAR_type (SSTATAR6)—Offset 240h

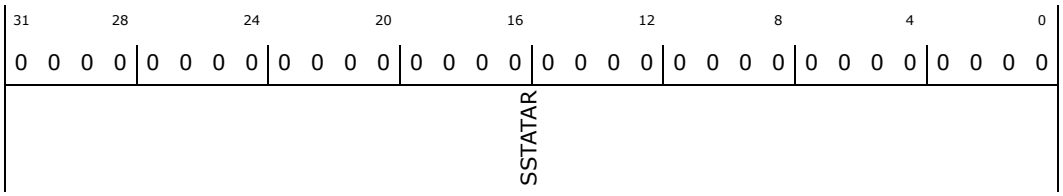
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 240h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.87 reg_DSTATAR_type (DSTATAR6)—Offset 248h

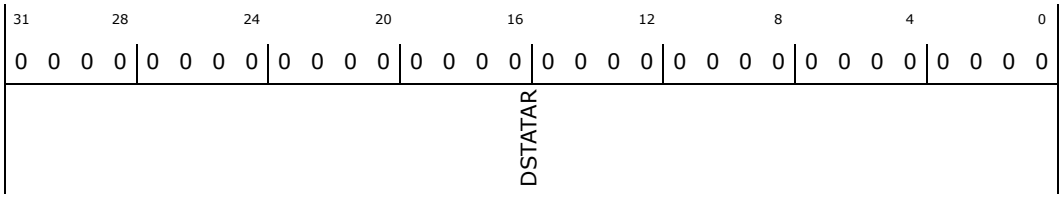
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 248h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.88 reg_CFG_LO_type (CFG_LO6)—Offset 250h

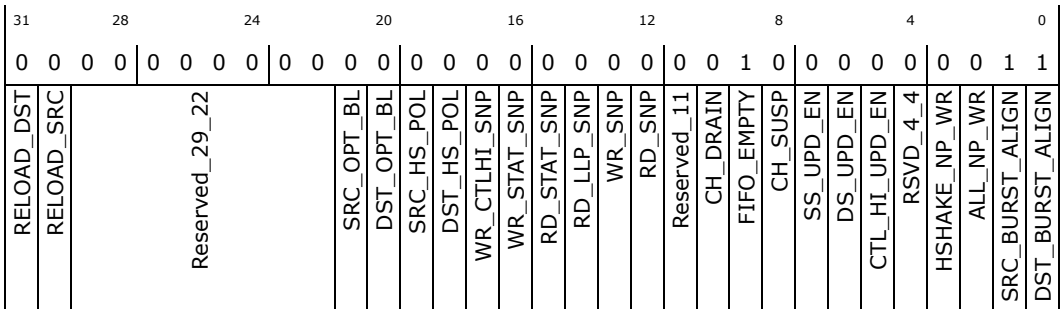
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 250h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.89 reg_CFG_HI_type (CFG_HI6)—Offset 254h

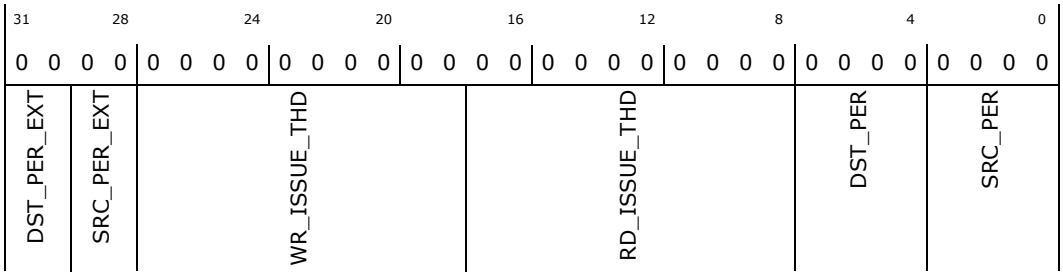
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 254h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.90 reg_SGR_type (SGR6)—Offset 258h

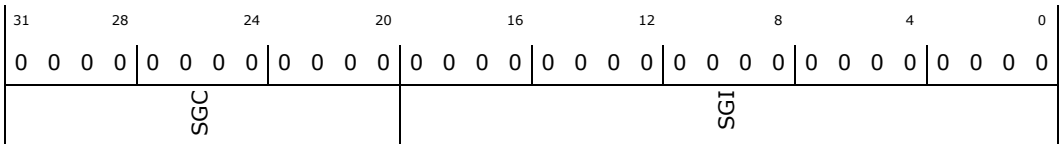
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 258h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.91 reg_DSR_type (DSR6)—Offset 260h

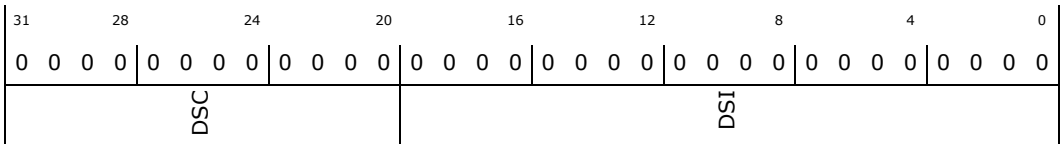
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 260h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.92 reg_SAR_type (SAR7)—Offset 268h

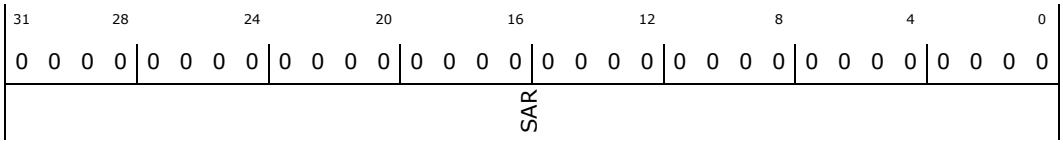
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 268h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.93 reg_DAR_type (DAR7)—Offset 270h

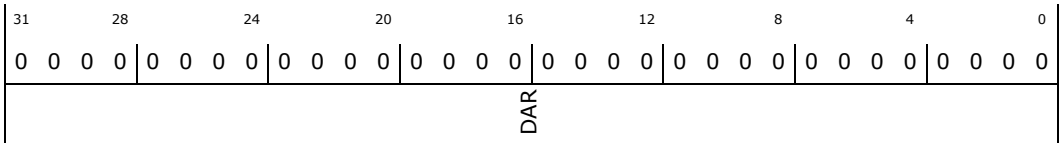
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

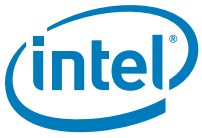
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 270h

Default: 00000000h





Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.1.94 reg_LLP_type (LLP7)—Offset 278h

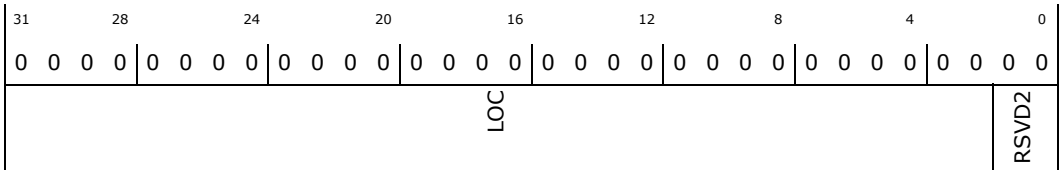
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 278h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.1.95 reg_CTL_LO_type (CTL_LO7)—Offset 280h

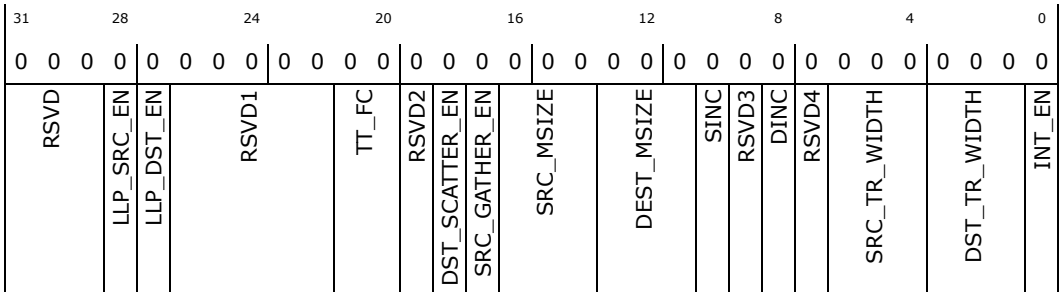
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 280h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.1.96 reg_CTL_HI_type (CTL_HI7)—Offset 284h

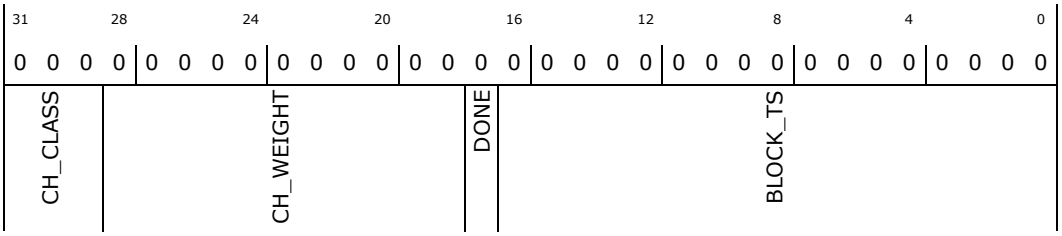
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

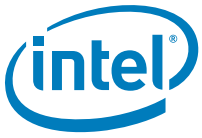
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 284h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.1.97 reg_SSTAT_type (SSTAT7)—Offset 288h

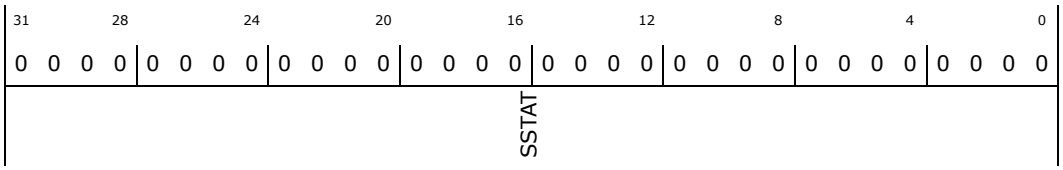
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 288h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.1.98 reg_DSTAT_type (DSTAT7)—Offset 290h

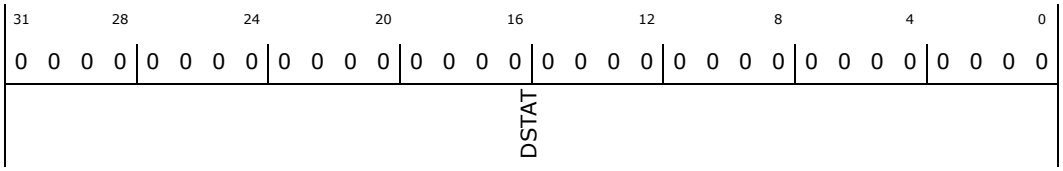
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 290h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.1.99 reg_SSTATAR_type (SSTATAR7)—Offset 298h

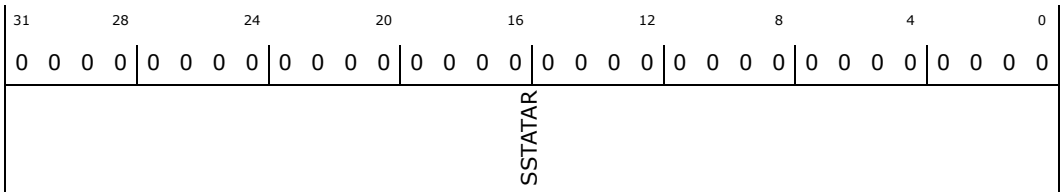
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 298h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.1.100 reg_DSTATAR_type (DSTATAR7)—Offset 2A0h

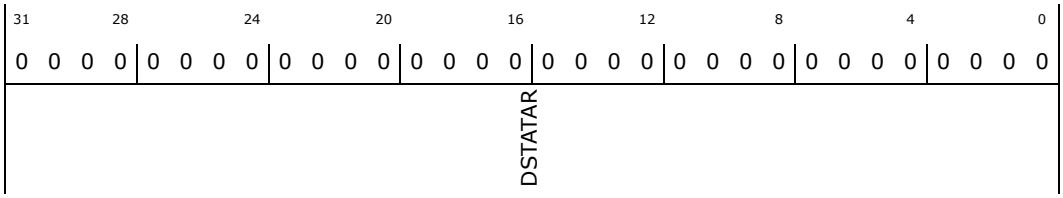
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.1.101 reg_CFG_LO_type (CFG_LO7)—Offset 2A8h

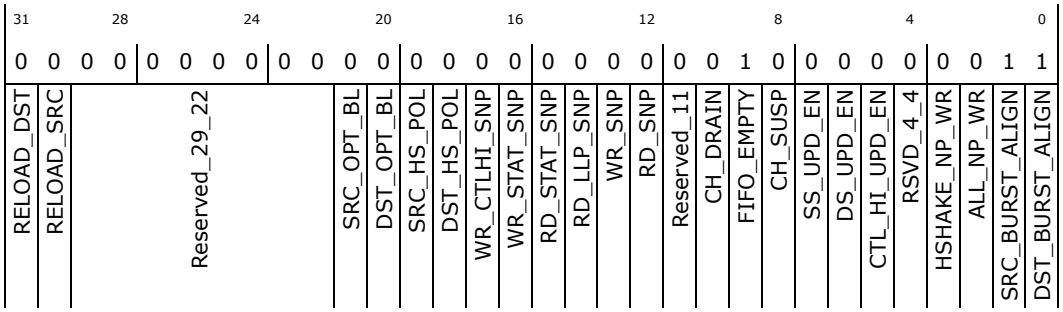
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2A8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.1.102 reg_CFG_HI_type (CFG_HI7)—Offset 2ACh

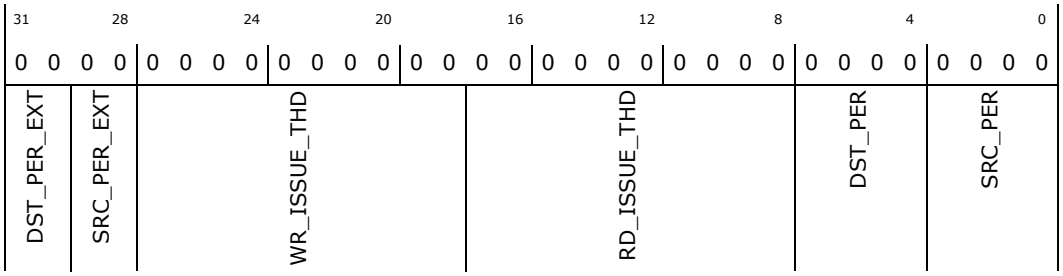
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

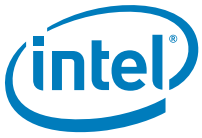
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2ACh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.



Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.1.103 reg_SGR_type (SGR7)—Offset 2B0h

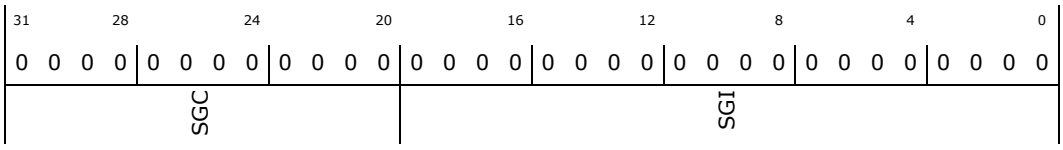
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.1.104 reg_DSR_type (DSR7)—Offset 2B8h

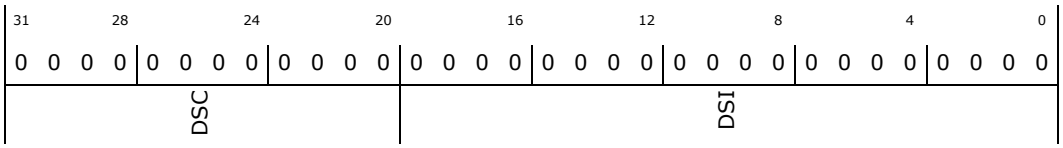
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.1.105 reg_Raw_type (RawTfr)—Offset 2C0h

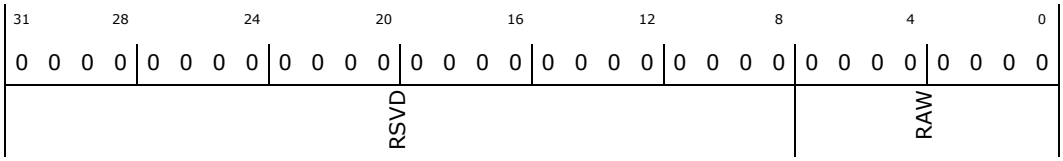
Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.1.106 reg_Raw_type (RawBlock)—Offset 2C8h

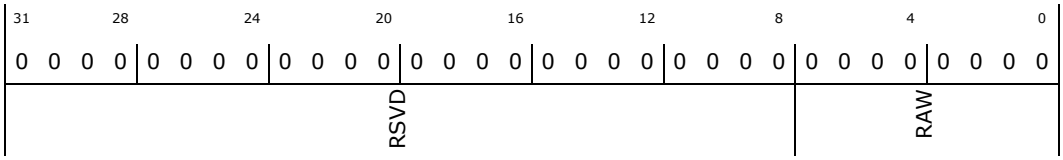
Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.1.107 reg_Raw_type (RawSrcTran)—Offset 2D0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw

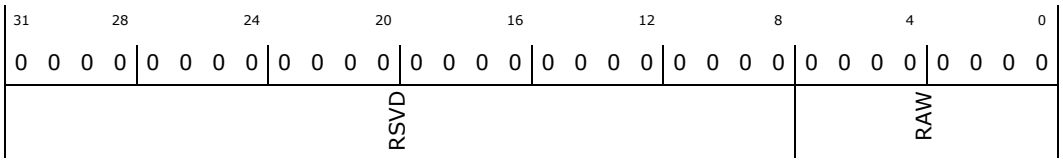
transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 2D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.1.108 reg_Raw_type (RawDstTran)—Offset 2D8h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

7:0	0x0 RO	**STATUS:** Interrupt status

8.1.113 reg_Status_type (StatusDstTran)—Offset 300h

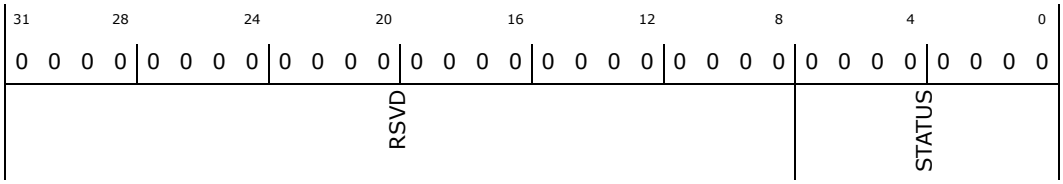
All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DMA.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 98000h] + 300h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**STATUS:** Interrupt status

8.1.114 reg_Status_type (StatusErr)—Offset 308h

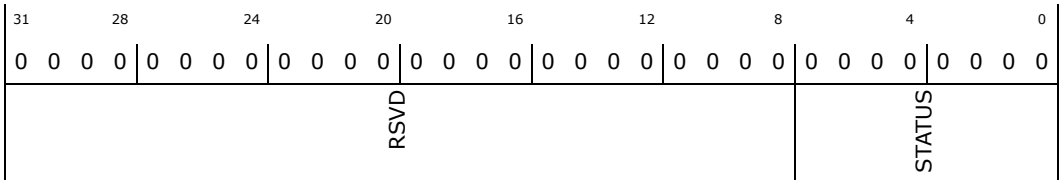
All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DMA.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 308h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**STATUS:** Interrupt status

8.1.115 reg_Mask_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation.

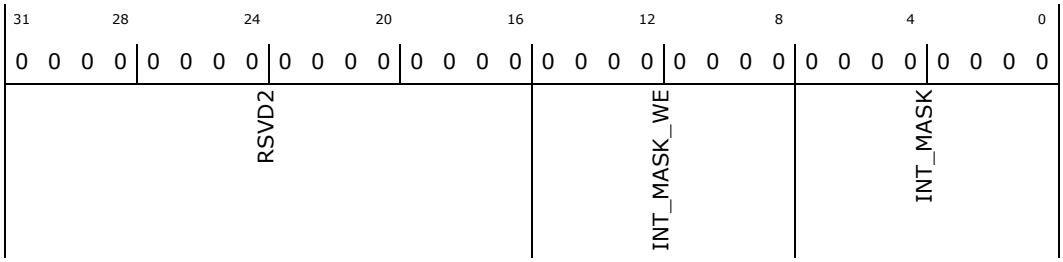
For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 310h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.1.116 reg_Mask_type (MaskBlock)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 318h

Default: 00000000h

31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.1.117 reg_Mask_type (MaskSrcTran)—Offset 320h

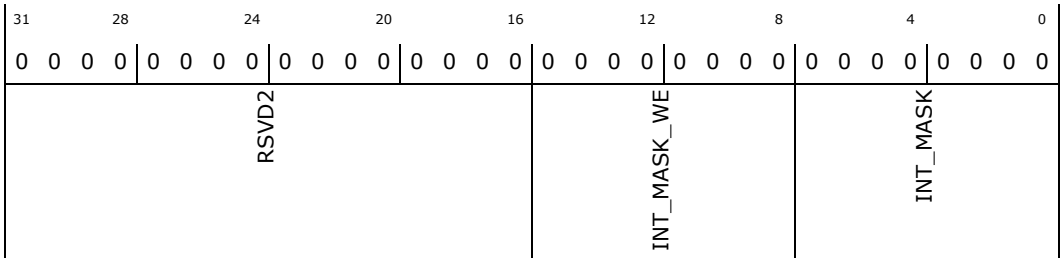
The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 320h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.1.118 reg_Mask_type (MaskDstTran)—Offset 328h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.1.119 reg_Mask_type (MaskErr)—Offset 330h

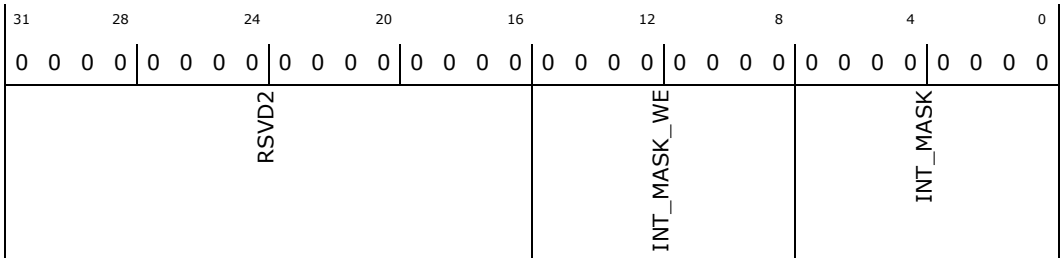
The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 330h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.1.120 reg_Clear_type (ClearTfr)—Offset 338h

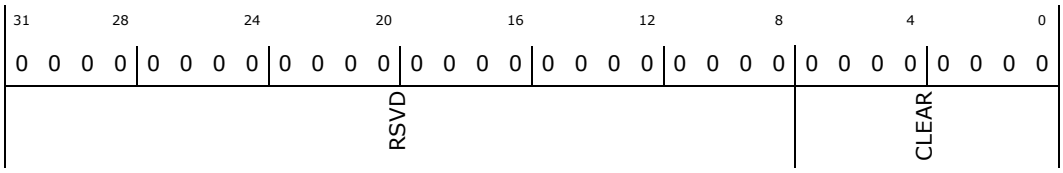
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 338h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.1.121 reg_Clear_type (ClearBlock)—Offset 340h

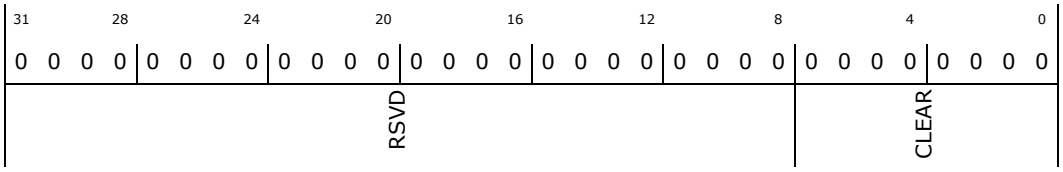
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 340h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.1.122 reg_Clear_type (ClearSrcTran)—Offset 348h

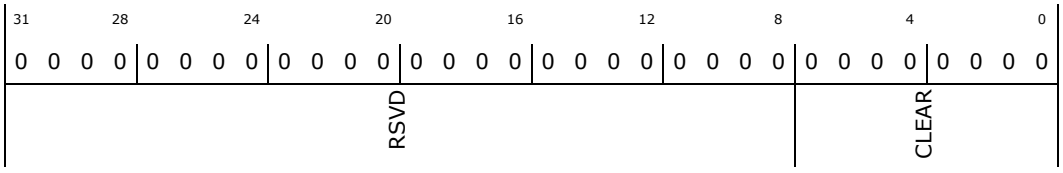
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 348h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.1.123 reg_Clear_type (ClearDstTran)—Offset 350h

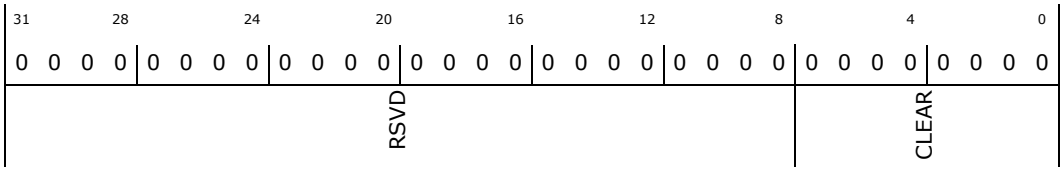
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 98000h] + 350h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.1.124 reg_Clear_type (ClearErr)—Offset 358h

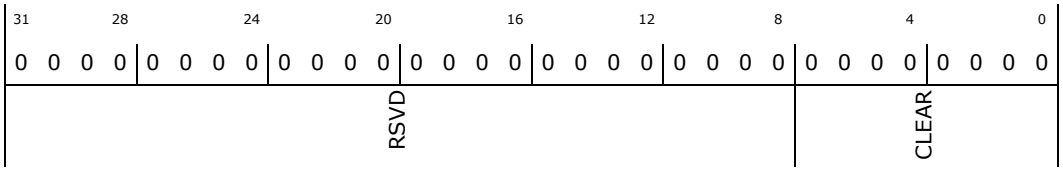
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 98000h] + 358h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.1.125 reg_StatusInt_type (StatusInt)—Offset 360h

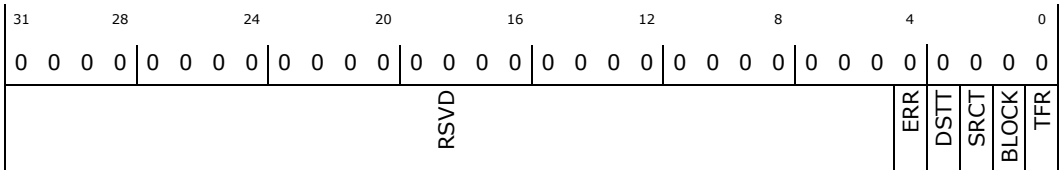
The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran,StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 360h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**RSVD:** Reserved
4	0x0 RO	**ERR:** OR of the contents of StatusErr register.
3	0x0 RO	**DSTT:** OR of the contents of StatusDst register.
2	0x0 RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0x0 RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0x0 RO	**TFR:** OR of the contents of StatusTfr register.

8.1.126 reg_DmaCfgReg_type (DmaCfgReg)—Offset 398h

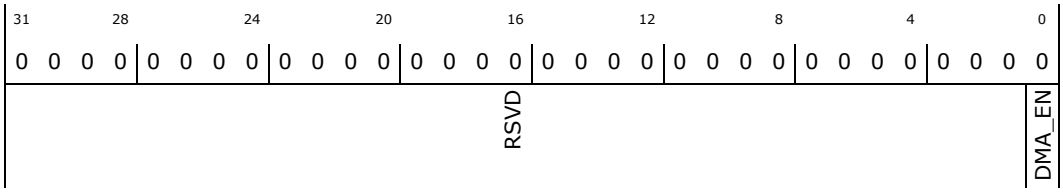
This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 398h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD:** Reserved
0	0x0 RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

8.1.127 reg_ChEnReg_type (ChEnReg)—Offset 3A0h

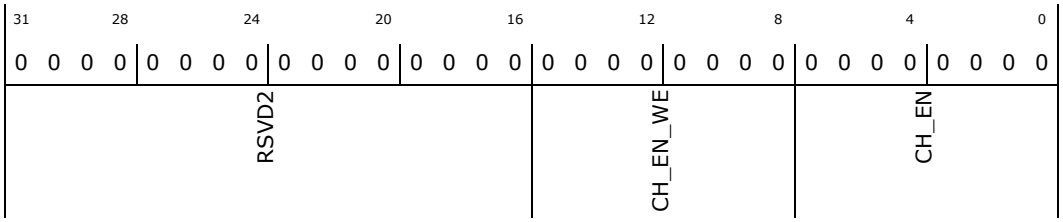
This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 3A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**CH_EN_WE:** Channel enable write enable.
7:0	0x0 RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

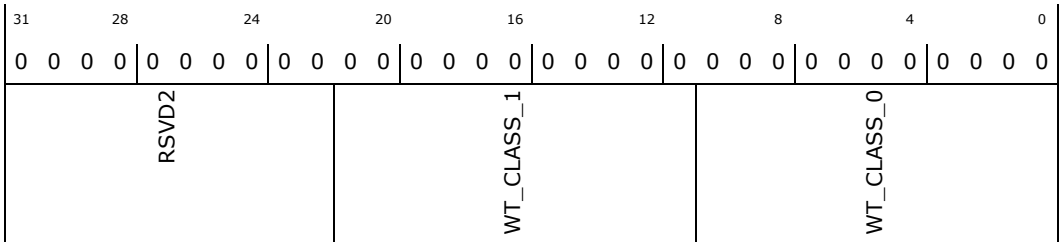
8.1.128 reg_CLASS_PRIORITY0_LO_type (ClassPriority0_LO)—Offset 3B8h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 3B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD2:** Reserved
21:11	0x0 RW	**WT_CLASS_1:** Class Weight 1: Value of K assigns a weight of (K+1) to Class 1. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_0:** Class Weight 0: Value of K assigns a weight of (K+1) to Class 0. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

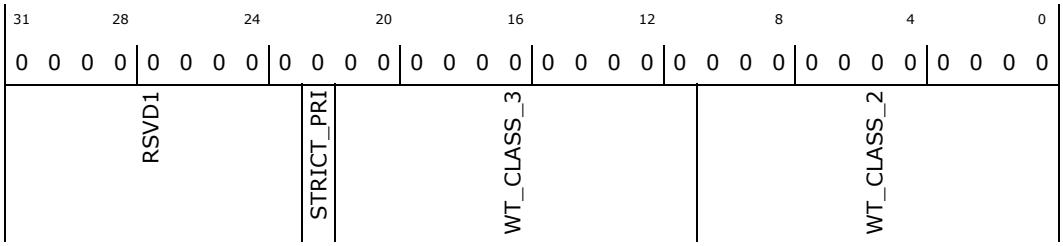
8.1.129 reg_CLASS_PRIORITY0_HI_type (ClassPriority0_HI)—Offset 3BCh

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 3BCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD1:** Reserved
22	0x0 RW	**STRICT_PRI:** If set, Higher class values will always have higher priorities than lower class values. If not set, round-robin arbitration will be used between different classes using WT_CLASS_n values.
21:11	0x0 RW	**WT_CLASS_3:** Class Weight 3: Value of K assigns a weight of (K+1) to Class 3. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_2:** Class Weight 2: Value of K assigns a weight of (K+1) to Class 2. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

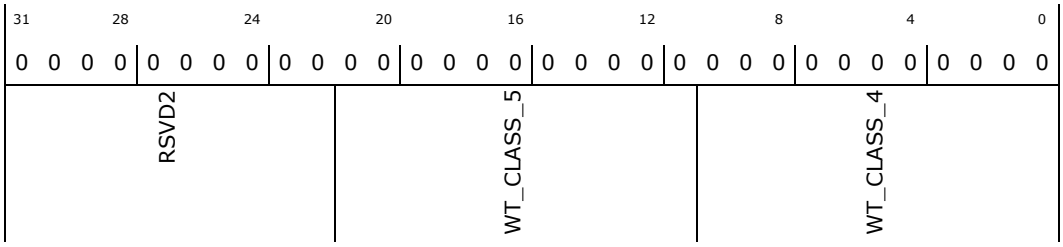
8.1.130 reg_CLASS_PRIORITY1_LO_type (ClassPriority1_LO)—Offset 3C0h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 3C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD2:** Reserved
21:11	0x0 RW	**WT_CLASS_5:** Class Weight 5: Value of K assigns a weight of (K+1) to Class 5. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_4:** Class Weight 4: Value of K assigns a weight of (K+1) to Class 4. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

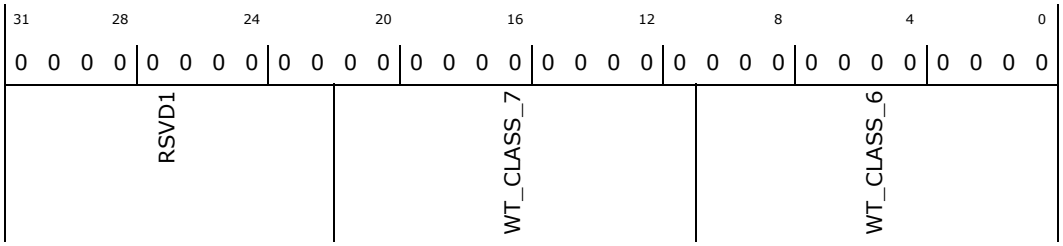
8.1.131 reg_CLASS_PRIORITY1_HI_type (ClassPriority1_HI)—Offset 3C4h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 3C4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD1:** Reserved
21:11	0x0 RW	**WT_CLASS_7:** Class Weight 7: Value of K assigns a weight of (K+1) to Class 7. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_6:** Class Weight 6: Value of K assigns a weight of (K+1) to Class 6. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

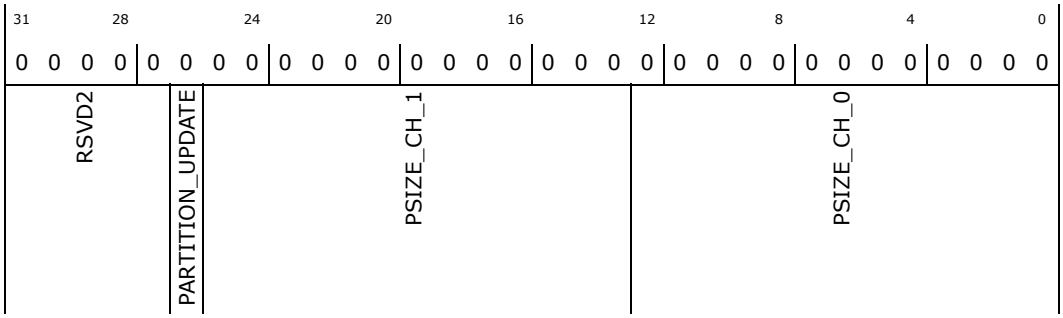
8.1.132 reg_FIFO_PARTITION0_LO_type (FifoPartition0_LO)—Offset 400h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 400h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD2:** Reserved
26	0x0 RW	**PARTITION_UPDATE:** SW needs to write to this bit for the partitioning assignments to take effect.
25:13	0x0 RW	**PSIZE_CH_1:** Partition Byte Size assigned to Channel 1. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_0:** Partition Byte Size assigned to Channel 0. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

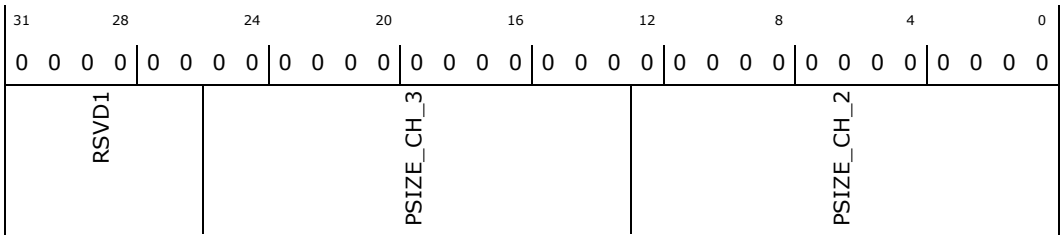
8.1.133 reg_FIFO_PARTITION0_HI_type (FifoPartition0_HI)—Offset 404h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 404h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_3:** Partition Byte Size assigned to Channel 3. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

Bit Range	Default & Access	Field Name (ID): Description
12:0	0x0 RW	**PSIZE_CH_2:** Partition Byte Size assigned to Channel 2. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

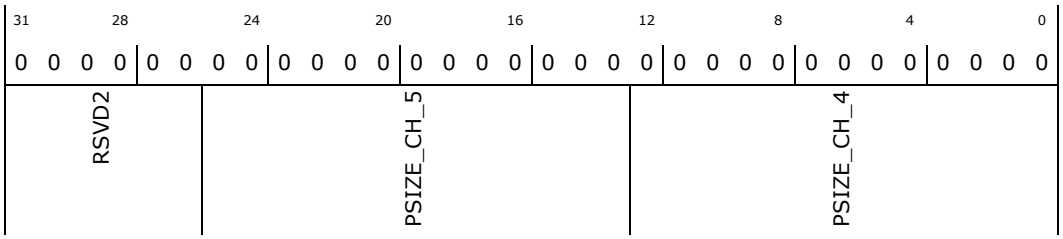
8.1.134 reg_FIFO_PARTITION1_LO_type (FifoPartition1_LO)—Offset 408h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 408h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD2:** Reserved
25:13	0x0 RW	**PSIZE_CH_5:** Partition Byte Size assigned to Channel 5. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_4:** Partition Byte Size assigned to Channel 4. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

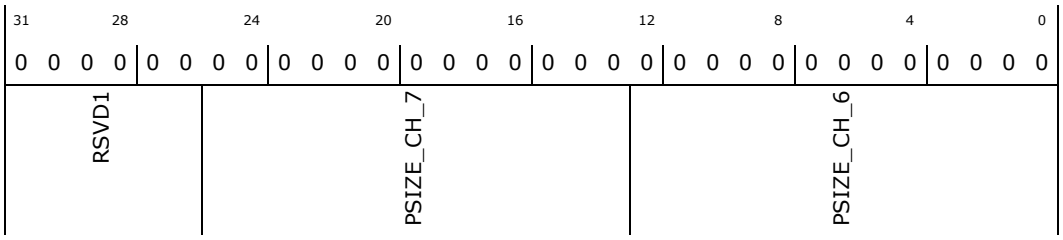
8.1.135 reg_FIFO_PARTITION1_HI_type (FifoPartition1_HI)—Offset 40Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 40Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_7:** Partition Byte Size assigned to Channel 7. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_6:** Partition Byte Size assigned to Channel 6. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

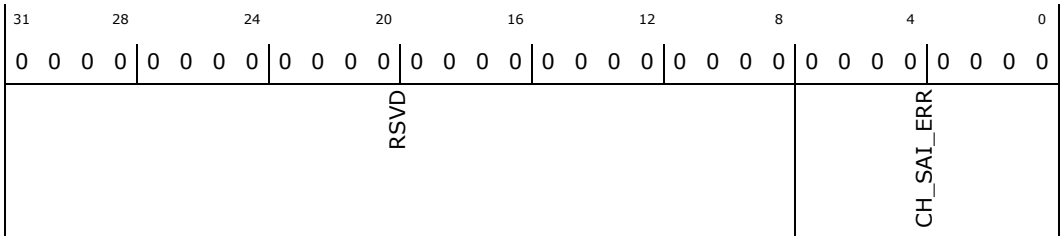
8.1.136 reg_SAI_Error_type (SAI_ERR)—Offset 410h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 410h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**CH_SAI_ERR:** 1: SAI Error occurred on Ch [n] 0: No SAI Error occurred on Ch [n] SAI_ERROR[n] is set by HW on SAI violation for channel [n]. All bits get cleared by SW when reading this register

8.1.137 reg_GLOBAL_CFG_type (GLOBAL_CFG)—Offset 418h

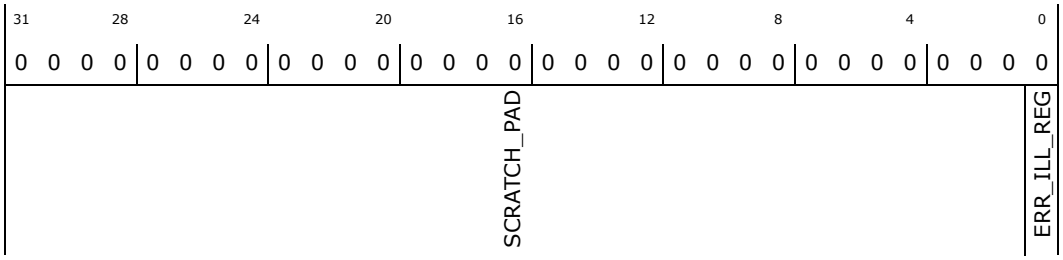
GLOBAL_CFG: GLOBAL DMA Configuration Register

Access Method

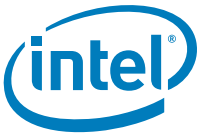
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 98000h] + 418h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future configuration and de-feature bits.
0	0x0 RW	**ERR_ILL_REG:** 0x1 : Issue ERR response on reading illegal (non-existing) registers 0x0 : Issue DVA response on reading illegal (non-existing) registers



8.2 LPE DMA 1 Memory Mapped I/O Registers

Table 53. Summary of DMA 1 Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_SAR_type (SAR0)—Offset 0h" on page 3454	00000000h

8.2.1 reg_SAR_type (SAR0)—Offset 0h

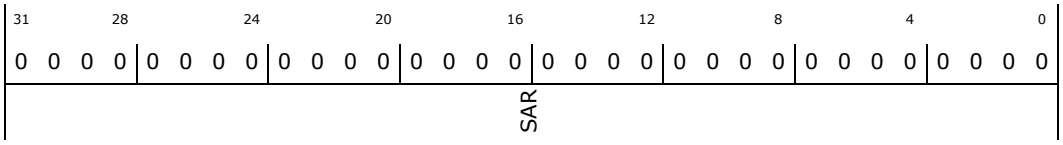
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.2 reg_DAR_type (DAR0)—Offset 8h

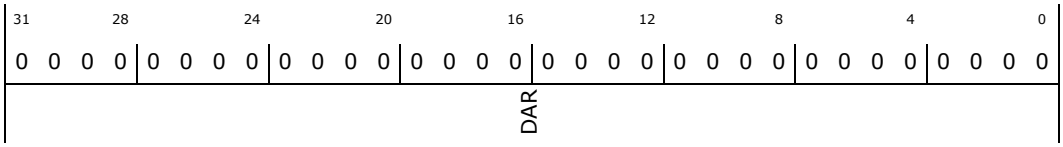
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.3 reg_LLP_type (LLP0)—Offset 10h

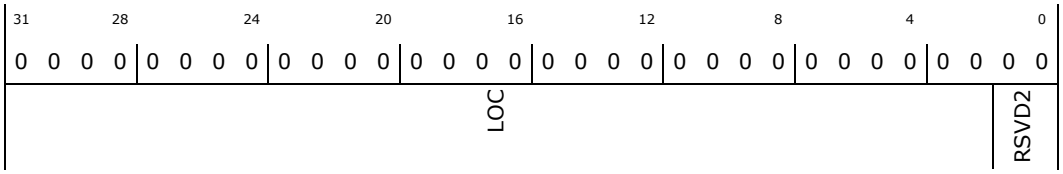
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

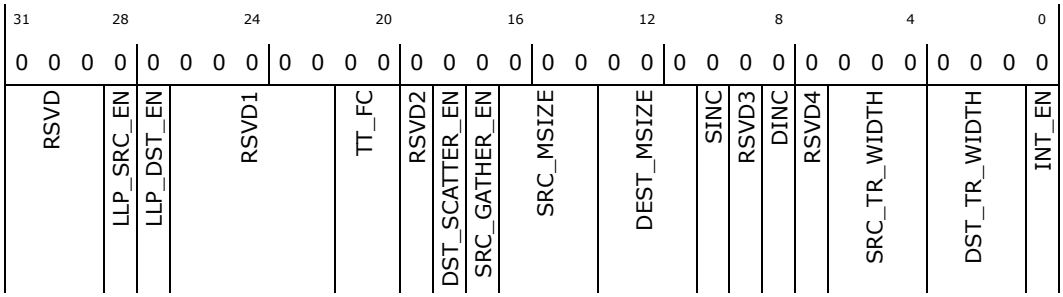
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.

Bit Range	Default & Access	Field Name (ID): Description
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.5 reg_CTL_HI_type (CTL_HI0)—Offset 1Ch

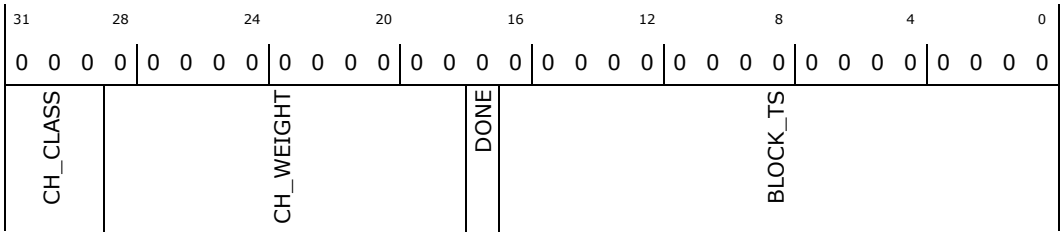
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.6 reg_SSTAT_type (SSTAT0)—Offset 20h

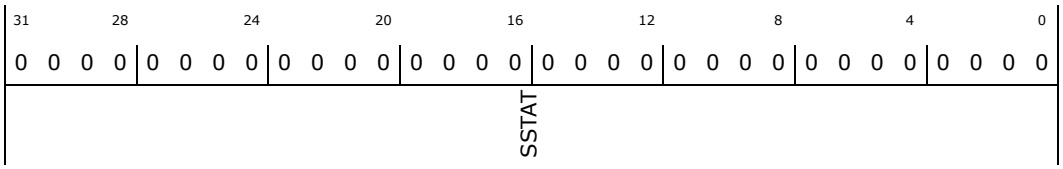
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 20h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.7 reg_DSTAT_type (DSTAT0)—Offset 28h

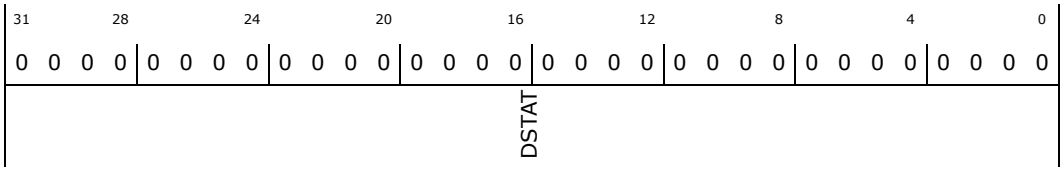
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

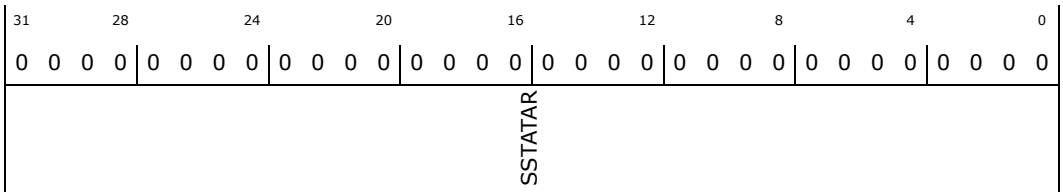
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

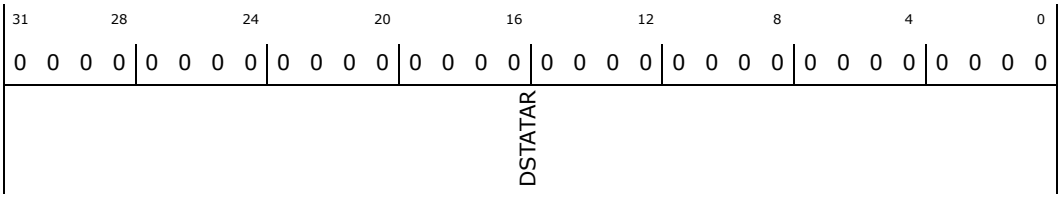
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

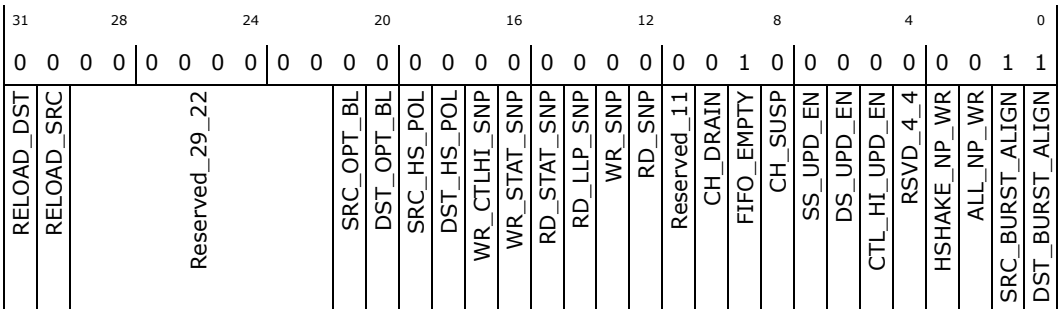
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 40h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.11 reg_CFG_HI_type (CFG_HI0)—Offset 44h

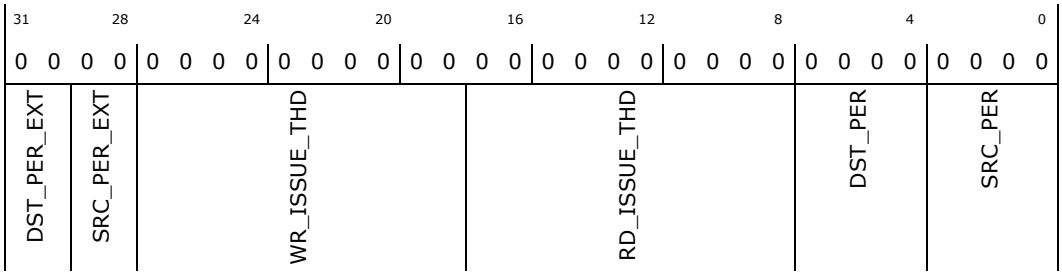
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 44h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.

Bit Range	Default & Access	Field Name (ID): Description
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.12 reg_SGR_type (SGR0)—Offset 48h

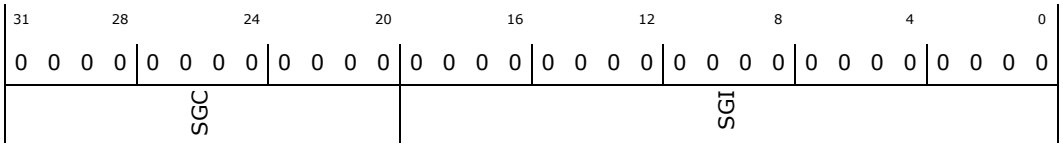
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.13 reg_DSR_type (DSR0)—Offset 50h

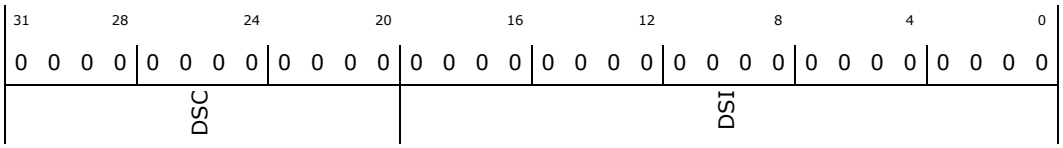
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 50h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.14 reg_SAR_type (SAR1)—Offset 58h

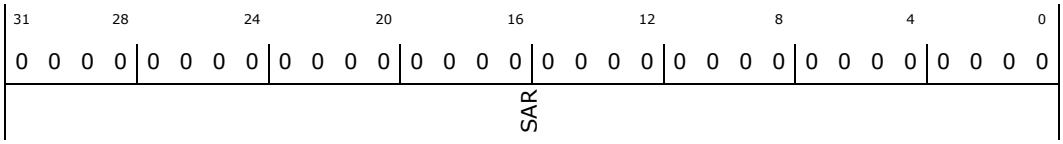
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 58h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.15 reg_DAR_type (DAR1)—Offset 60h

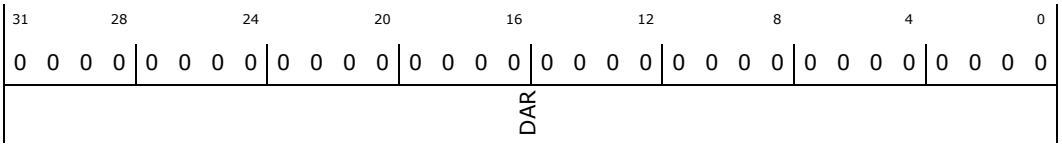
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 60h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.16 reg_LLP_type (LLP1)—Offset 68h

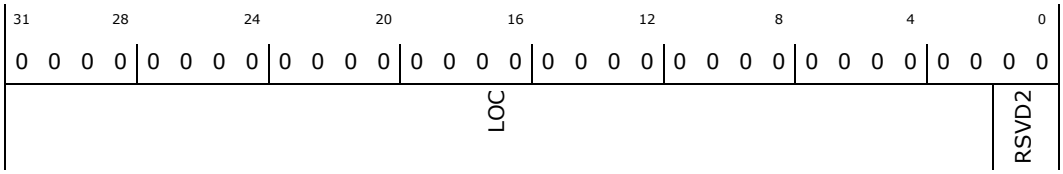
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 68h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.17 reg_CTL_LO_type (CTL_LO1)—Offset 70h

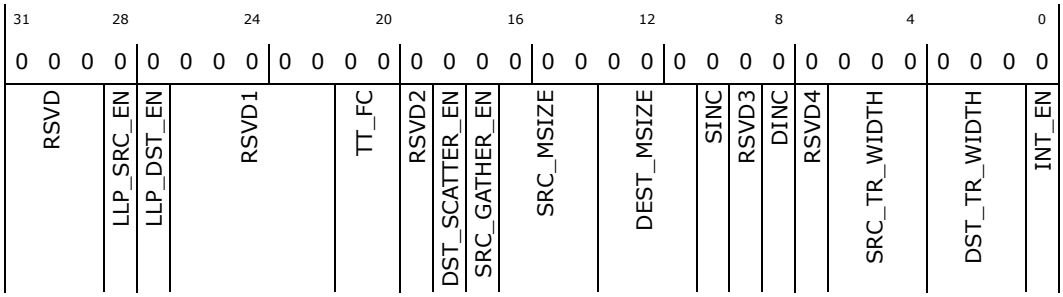
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 70h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)

Bit Range	Default & Access	Field Name (ID): Description
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.18 reg_CTL_HI_type (CTL_HI1)—Offset 74h

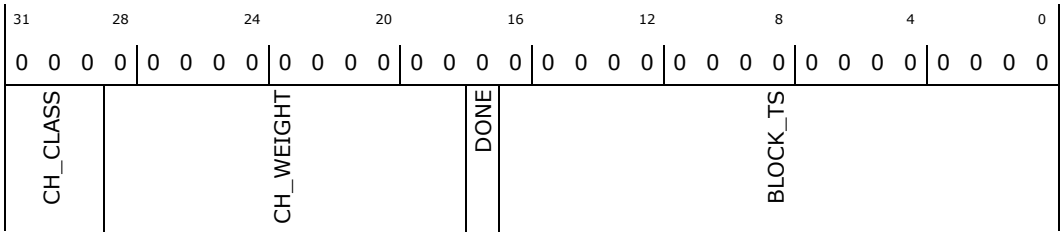
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.19 reg_SSTAT_type (SSTAT1)—Offset 78h

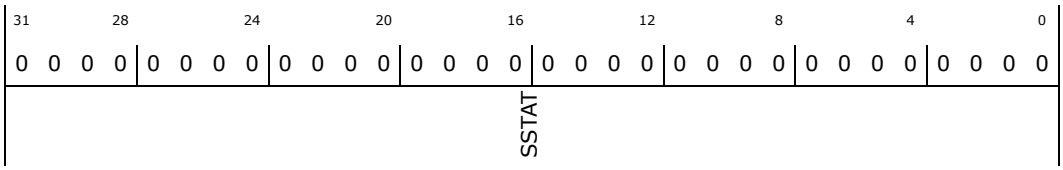
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.20 reg_DSTAT_type (DSTAT1)—Offset 80h

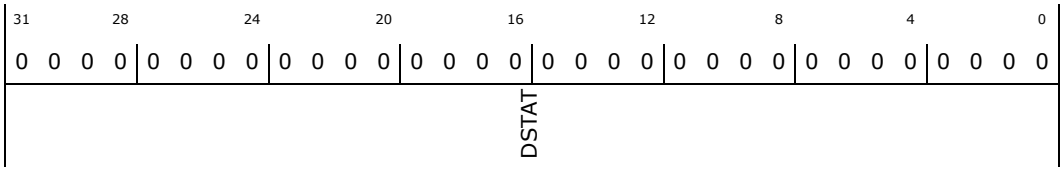
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 80h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.21 reg_SSTATAR_type (SSTATAR1)—Offset 88h

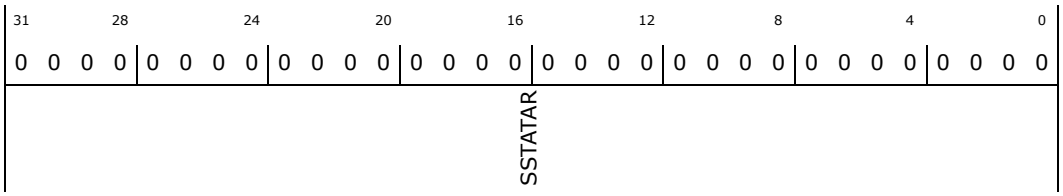
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 88h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.22 reg_DSTATAR_type (DSTATAR1)—Offset 90h

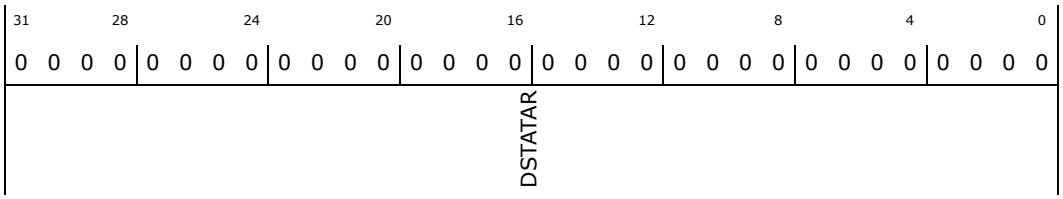
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 90h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.23 reg_CFG_LO_type (CFG_LO1)—Offset 98h

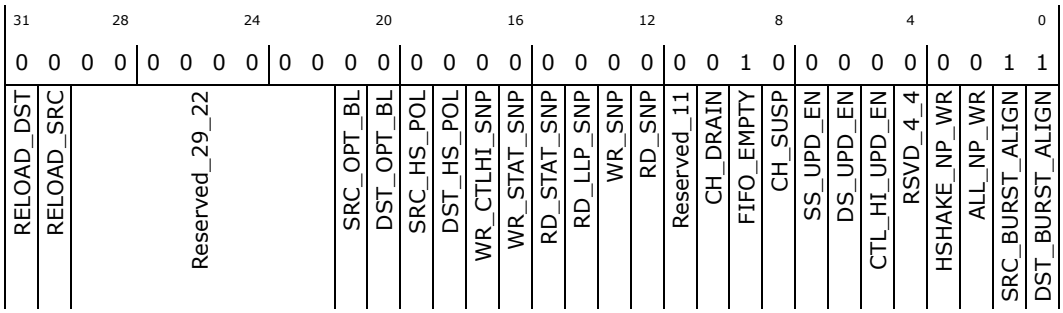
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 98h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.24 reg_CFG_HI_type (CFG_HI1)—Offset 9Ch

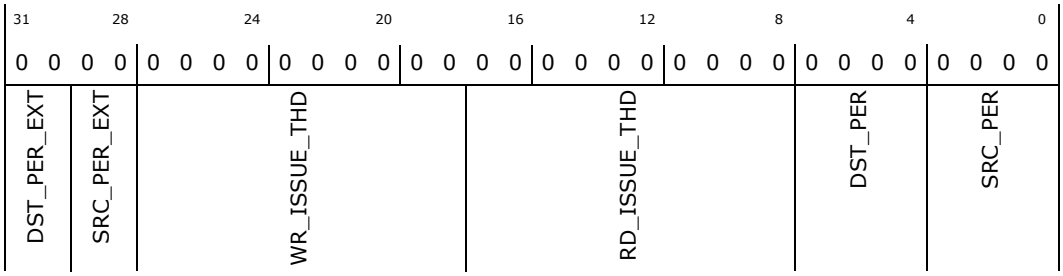
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 9Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.25 reg_SGR_type (SGR1)—Offset A0h

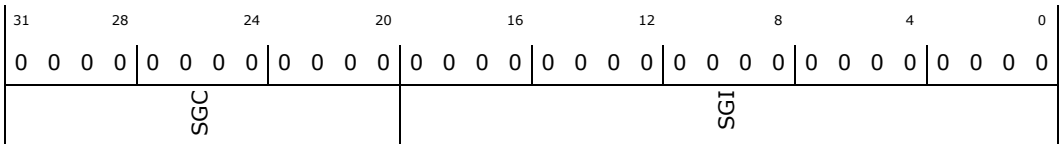
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.26 reg_DSR_type (DSR1)—Offset A8h

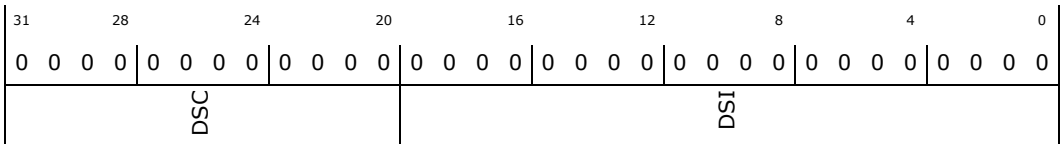
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.27 reg_SAR_type (SAR2)—Offset B0h

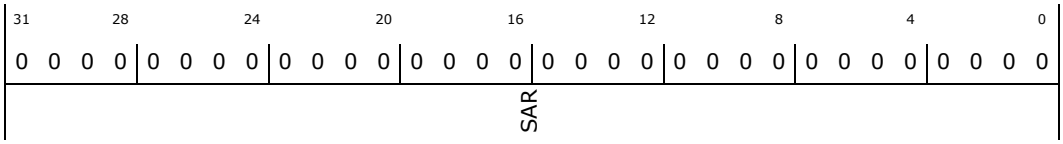
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.28 reg_DAR_type (DAR2)—Offset B8h

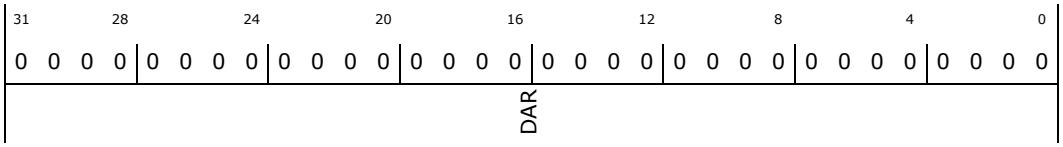
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.29 reg_LLP_type (LLP2)—Offset C0h

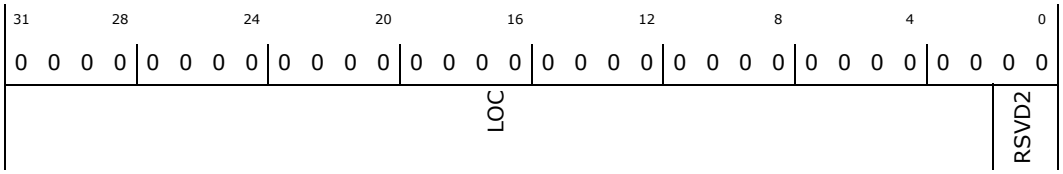
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

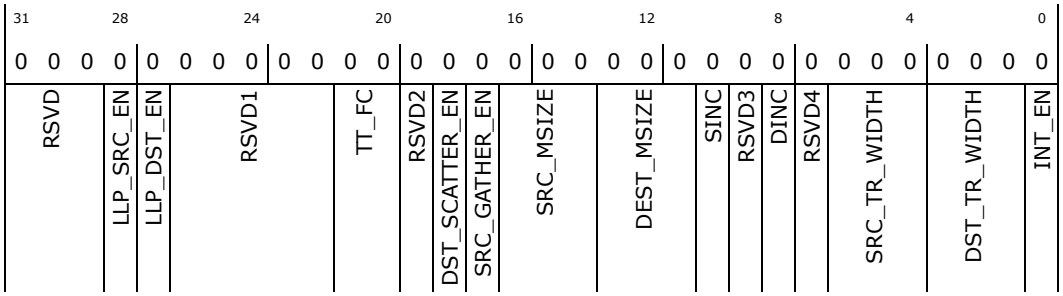
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.31 reg_CTL_HI_type (CTL_HI2)—Offset CCh

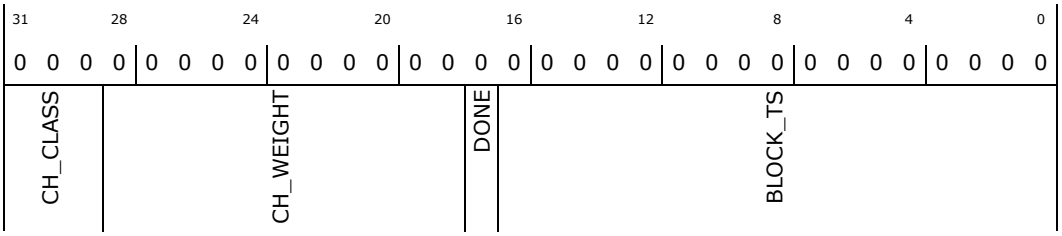
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + CCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.32 reg_SSTAT_type (SSTAT2)—Offset D0h

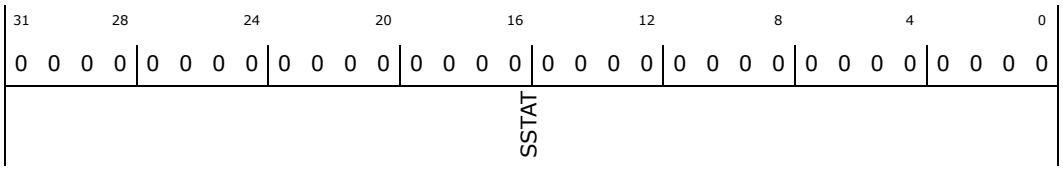
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.33 reg_DSTAT_type (DSTAT2)—Offset D8h

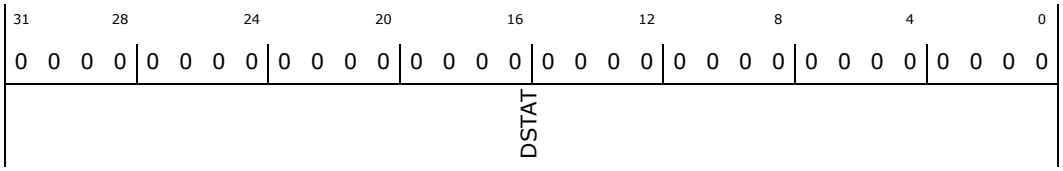
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.34 reg_SSTATAR_type (SSTATAR2)—Offset E0h

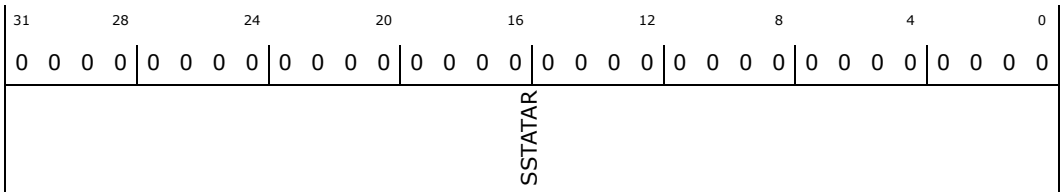
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.35 reg_DSTATAR_type (DSTATAR2)—Offset E8h

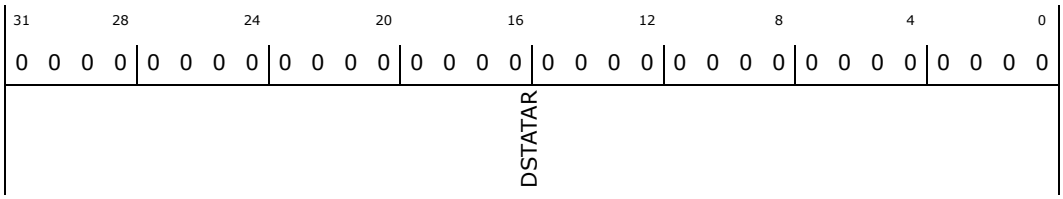
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.36 reg_CFG_LO_type (CFG_LO2)—Offset F0h

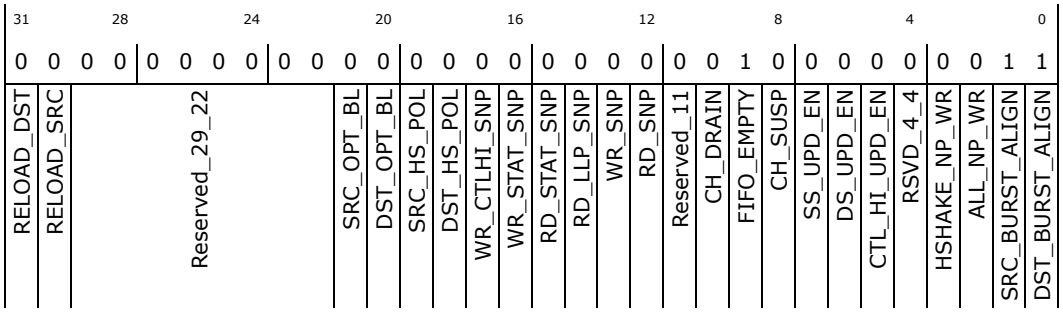
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + F0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.37 reg_CFG_HI_type (CFG_HI2)—Offset F4h

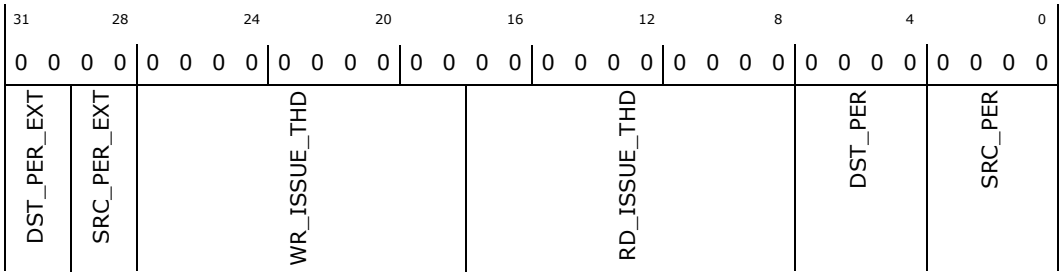
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + F4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.38 reg_SGR_type (SGR2)—Offset F8h

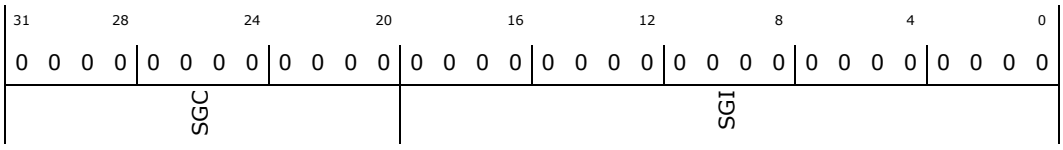
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + F8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.39 reg_DSR_type (DSR2)—Offset 100h

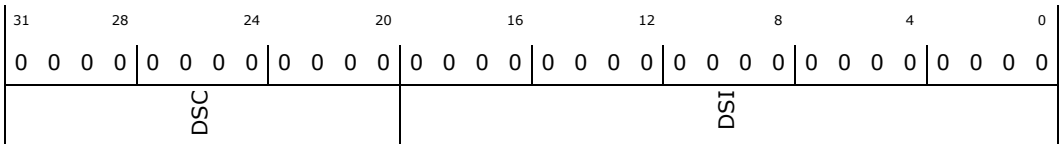
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 100h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.40 reg_SAR_type (SAR3)—Offset 108h

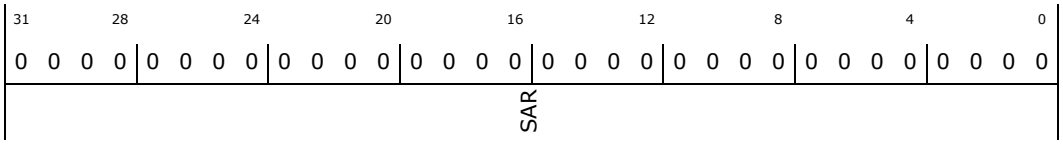
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 108h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.41 reg_DAR_type (DAR3)—Offset 110h

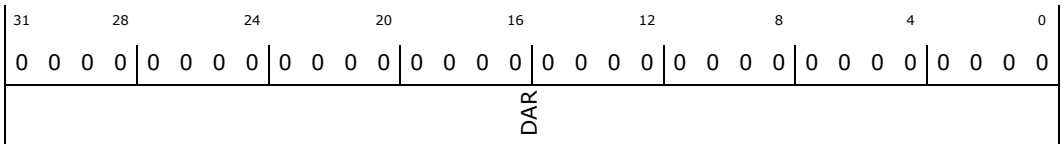
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 110h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.42 reg_LLP_type (LLP3)—Offset 118h

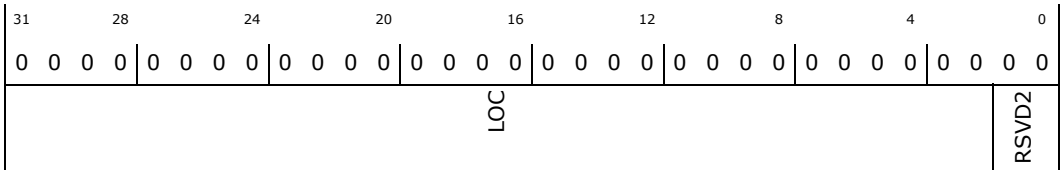
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 118h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.43 reg_CTL_LO_type (CTL_LO3)—Offset 120h

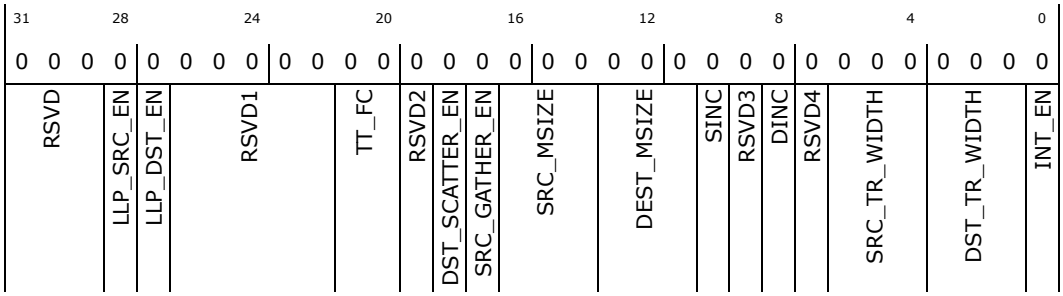
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

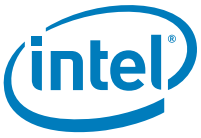
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 120h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD



Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.44 reg_CTL_HI_type (CTL_HI3)—Offset 124h

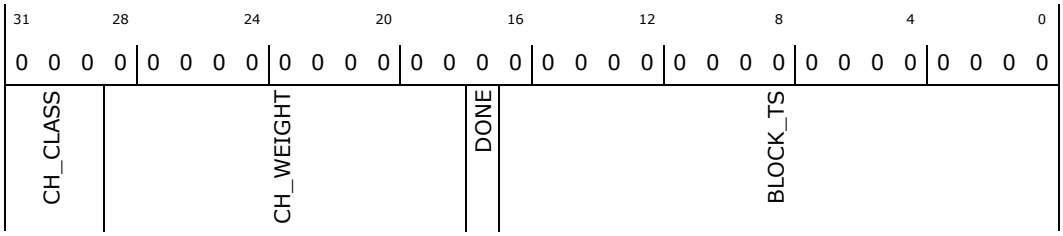
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 124h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.45 reg_SSTAT_type (SSTAT3)—Offset 128h

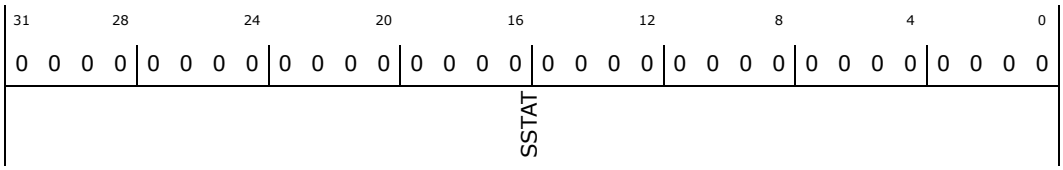
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 128h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.46 reg_DSTAT_type (DSTAT3)—Offset 130h

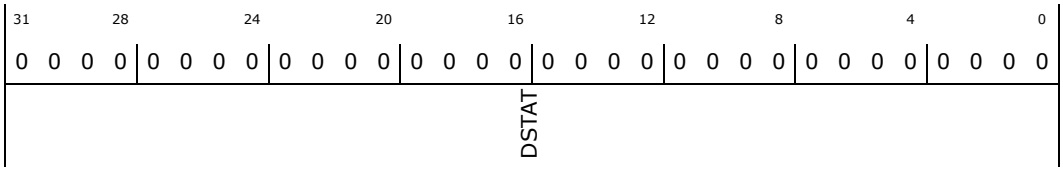
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 130h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.47 reg_SSTATAR_type (SSTATAR3)—Offset 138h

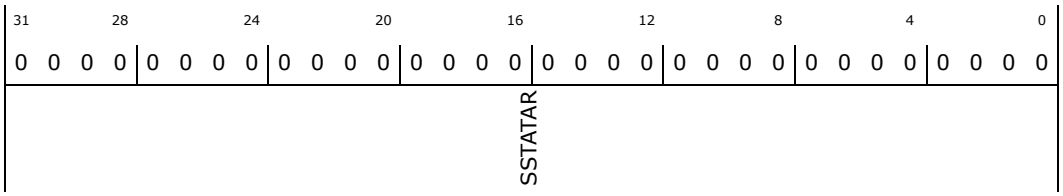
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 138h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.48 reg_DSTATAR_type (DSTATAR3)—Offset 140h

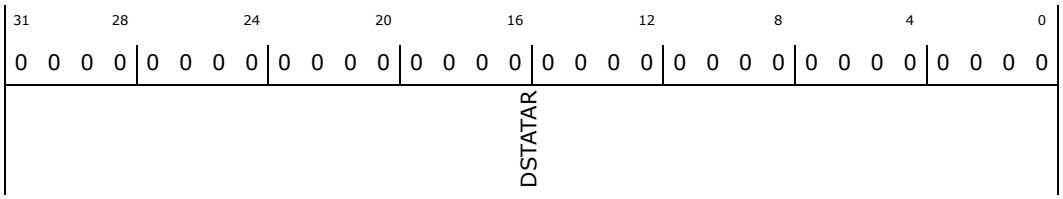
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 140h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.49 reg_CFG_LO_type (CFG_LO3)—Offset 148h

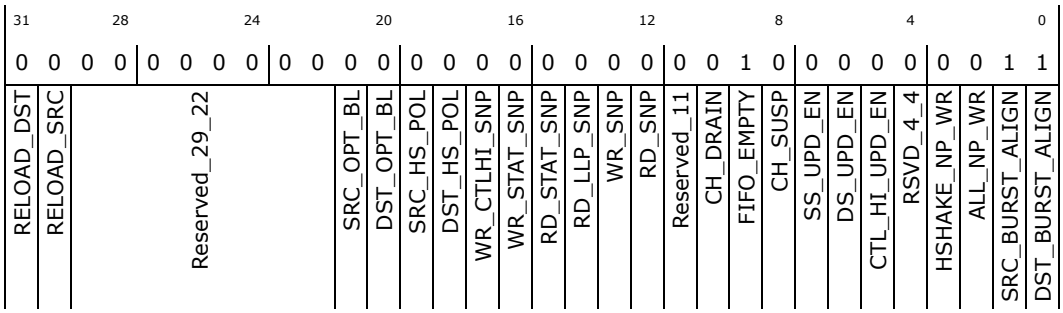
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 148h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.50 reg_CFG_HI_type (CFG_HI3)—Offset 14Ch

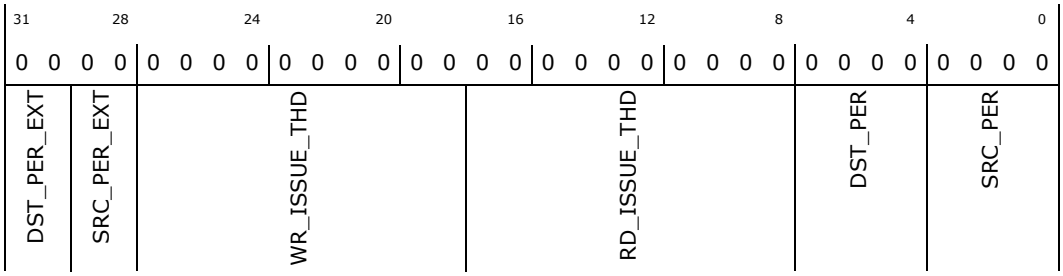
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 14Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.51 reg_SGR_type (SGR3)—Offset 150h

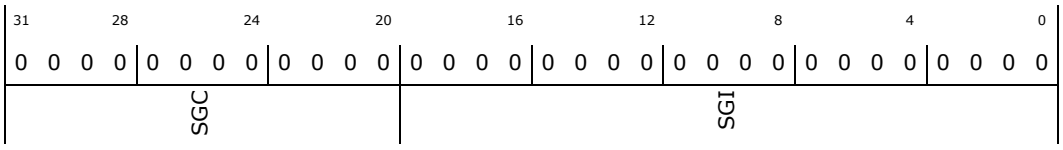
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 150h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.52 reg_DSR_type (DSR3)—Offset 158h

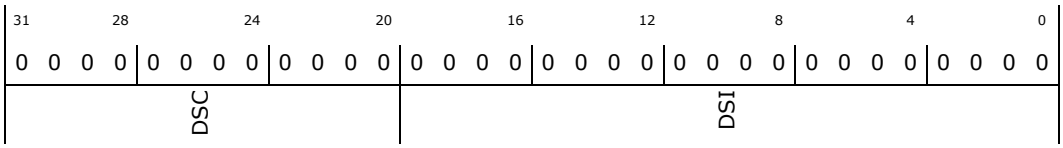
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 158h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.53 reg_SAR_type (SAR4)—Offset 160h

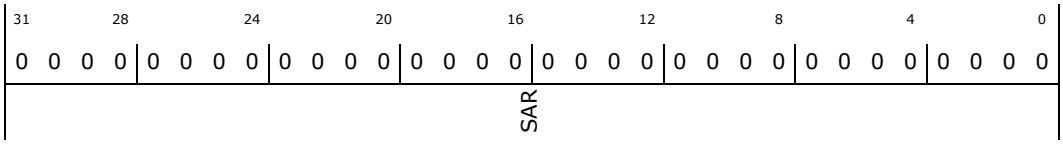
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 160h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.54 reg_DAR_type (DAR4)—Offset 168h

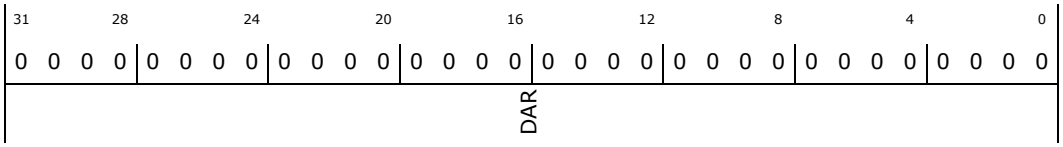
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 168h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.55 reg_LLP_type (LLP4)—Offset 170h

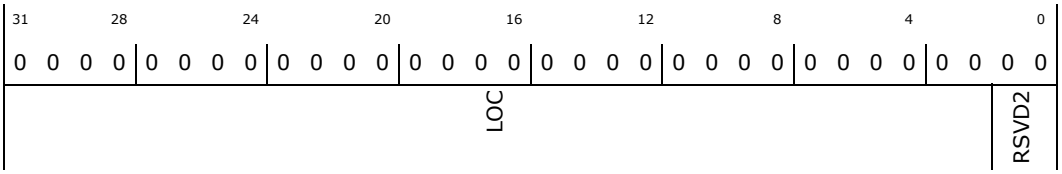
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 170h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

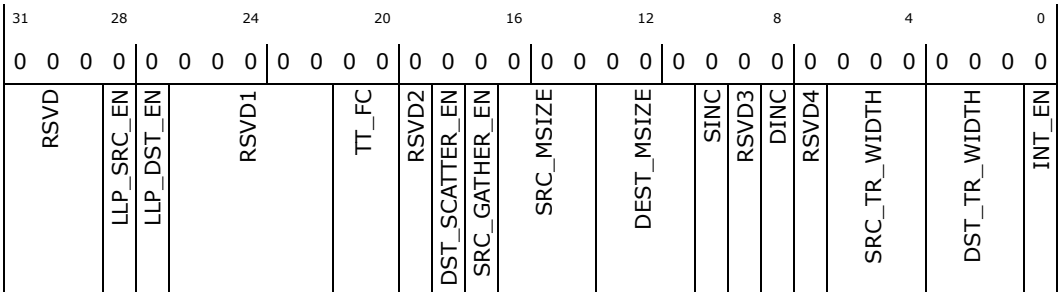
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 178h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.57 reg_CTL_HI_type (CTL_HI4)—Offset 17Ch

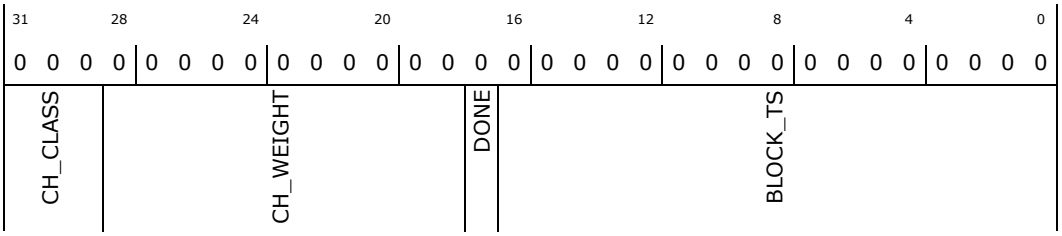
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 17Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.58 reg_SSTAT_type (SSTAT4)—Offset 180h

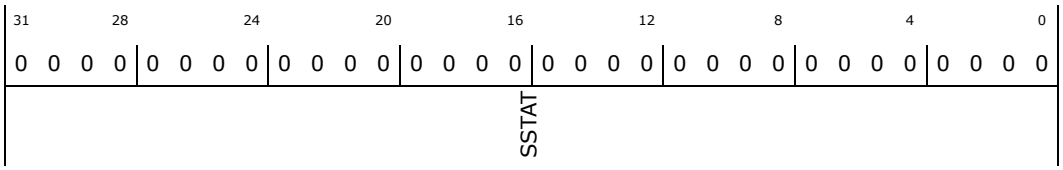
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 180h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.59 reg_DSTAT_type (DSTAT4)—Offset 188h

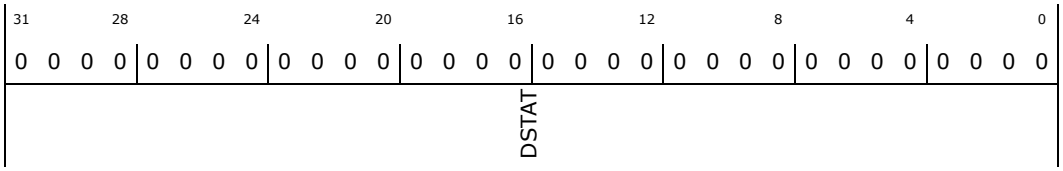
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 188h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.60 reg_SSTATAR_type (SSTATAR4)—Offset 190h

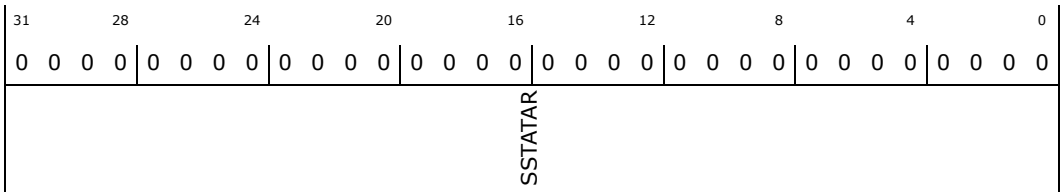
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 190h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.61 reg_DSTATAR_type (DSTATAR4)—Offset 198h

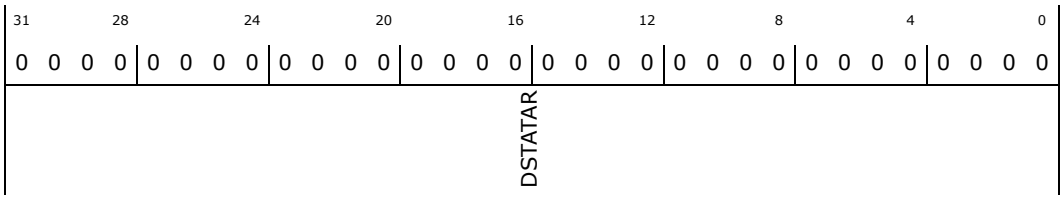
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 198h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.62 reg_CFG_LO_type (CFG_LO4)—Offset 1A0h

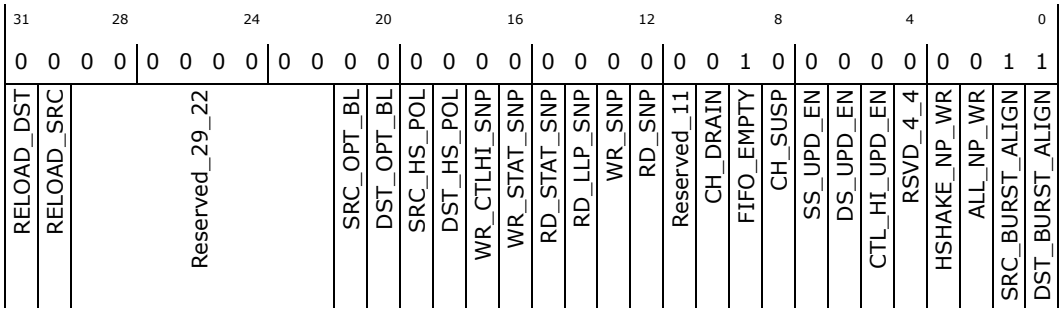
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1A0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.63 reg_CFG_HI_type (CFG_HI4)—Offset 1A4h

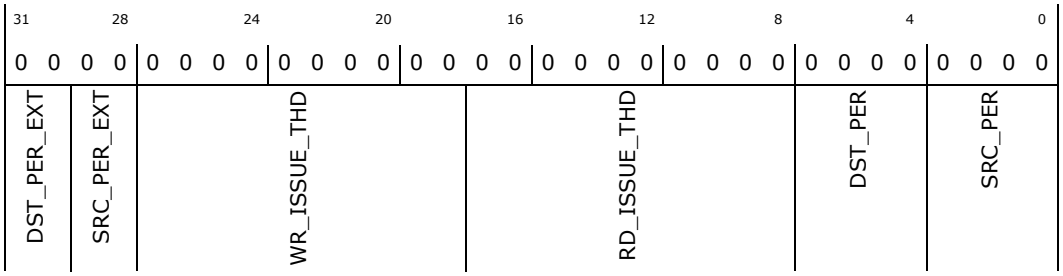
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 1A4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.64 reg_SGR_type (SGR4)—Offset 1A8h

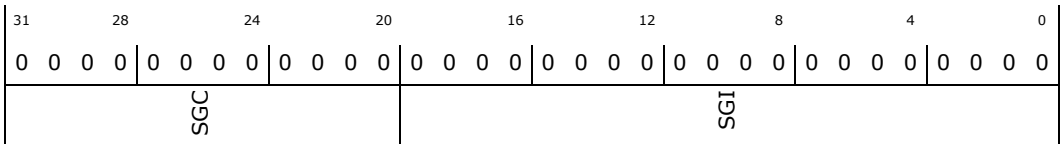
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.65 reg_DSR_type (DSR4)—Offset 1B0h

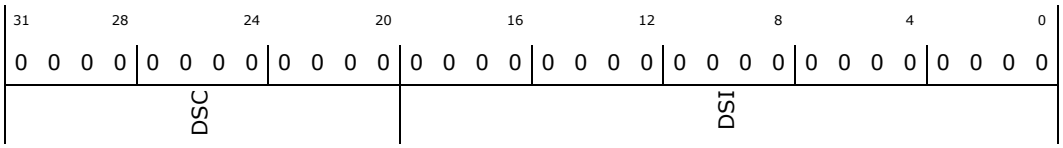
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.66 reg_SAR_type (SAR5)—Offset 1B8h

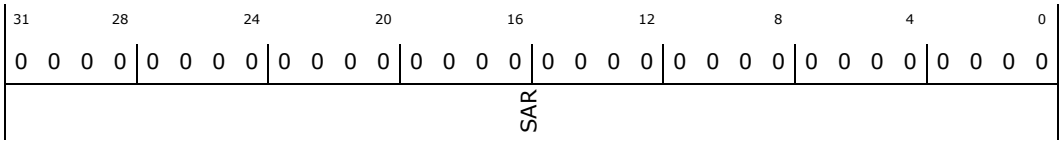
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.67 reg_DAR_type (DAR5)—Offset 1C0h

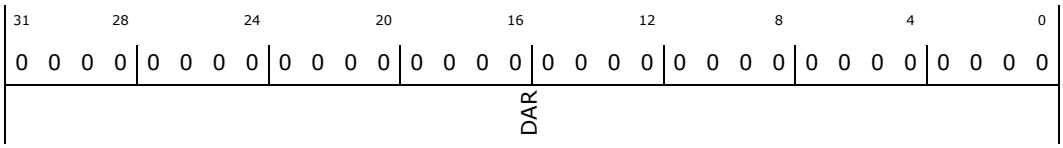
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

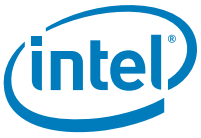
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 1C0h

Default: 00000000h





Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.68 reg_LLP_type (LLP5)—Offset 1C8h

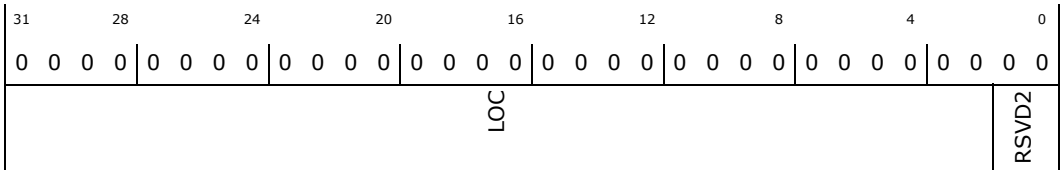
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 1C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.69 reg_CTL_LO_type (CTL_LO5)—Offset 1D0h

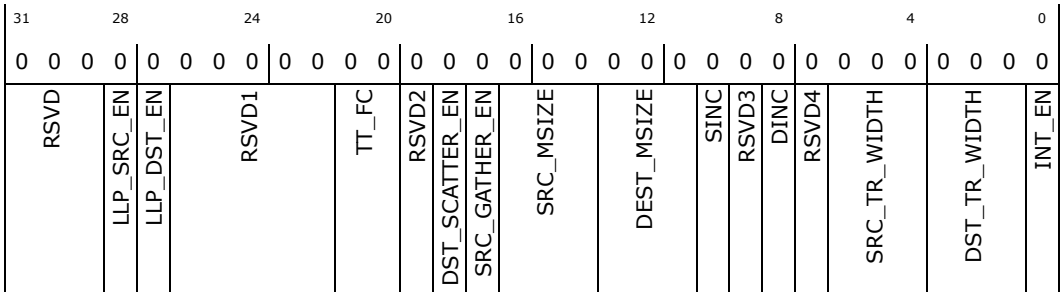
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.70 reg_CTL_HI_type (CTL_HI5)—Offset 1D4h

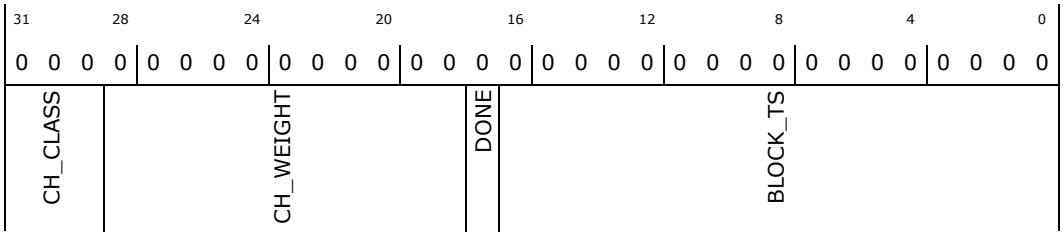
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1D4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.71 reg_SSTAT_type (SSTAT5)—Offset 1D8h

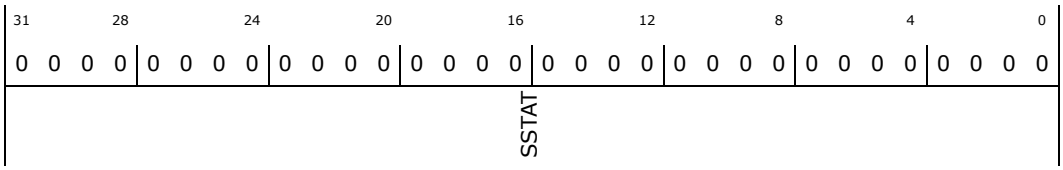
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 1D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.72 reg_DSTAT_type (DSTAT5)—Offset 1E0h

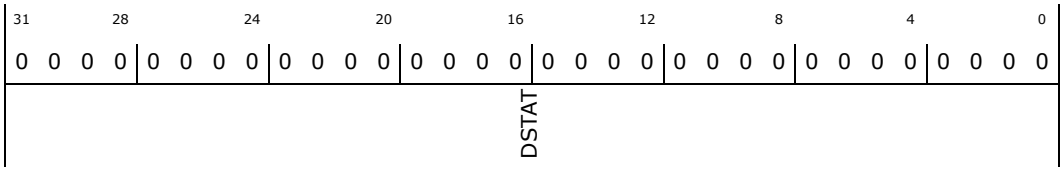
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.73 reg_SSTATAR_type (SSTATAR5)—Offset 1E8h

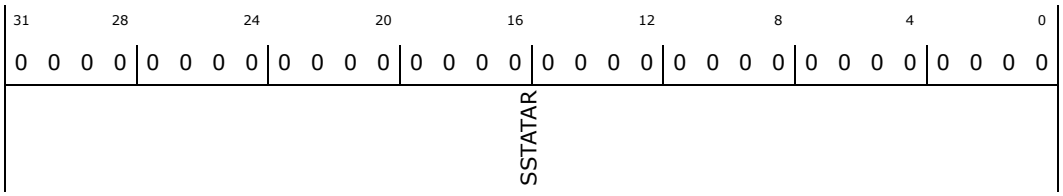
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.74 reg_DSTATAR_type (DSTATAR5)—Offset 1F0h

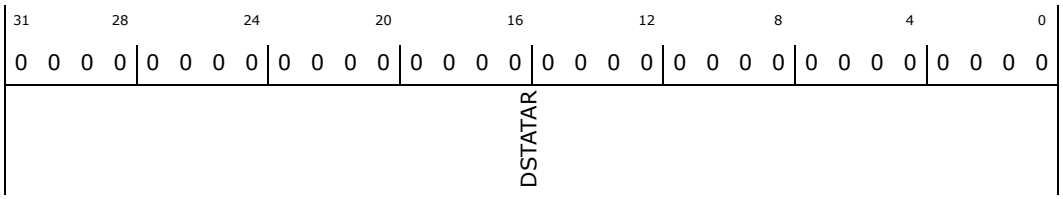
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1F0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.75 reg_CFG_LO_type (CFG_LO5)—Offset 1F8h

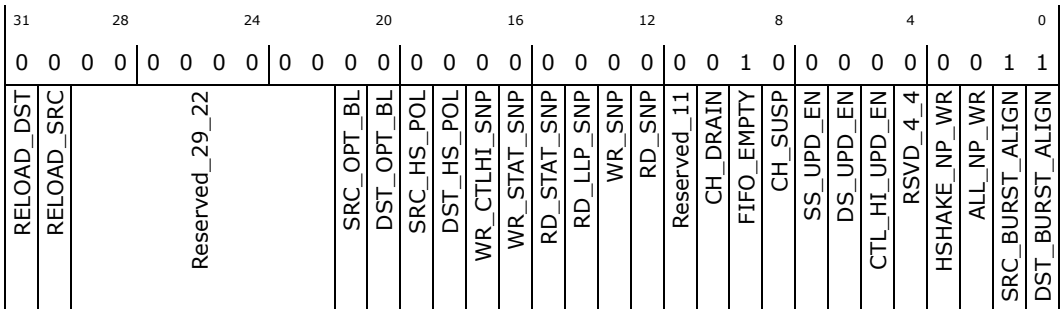
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1F8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.76 reg_CFG_HI_type (CFG_HI5)—Offset 1FCh

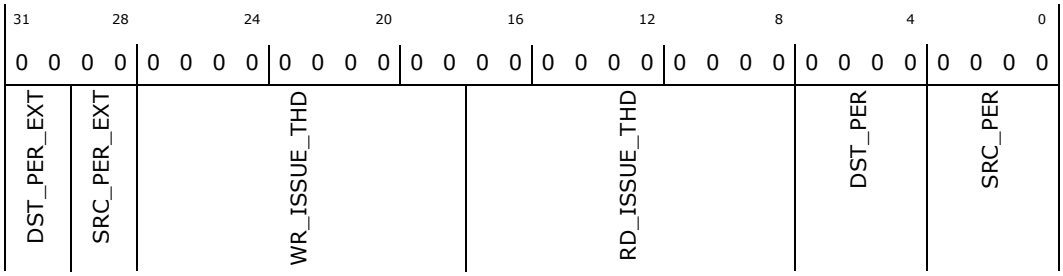
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 1FCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.77 reg_SGR_type (SGR5)—Offset 200h

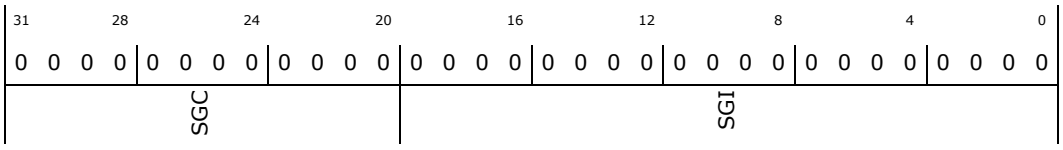
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 200h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.78 reg_DSR_type (DSR5)—Offset 208h

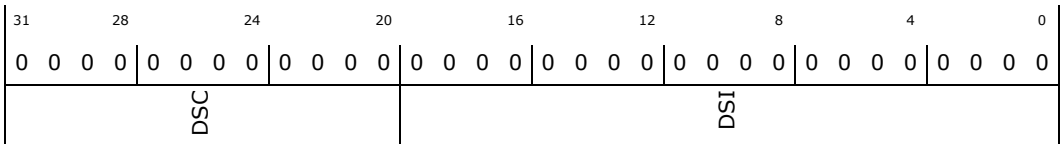
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 208h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.79 reg_SAR_type (SAR6)—Offset 210h

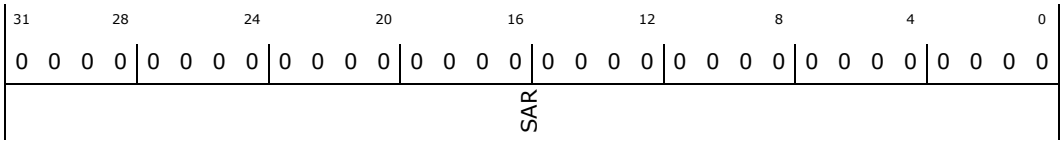
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 210h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.80 reg_DAR_type (DAR6)—Offset 218h

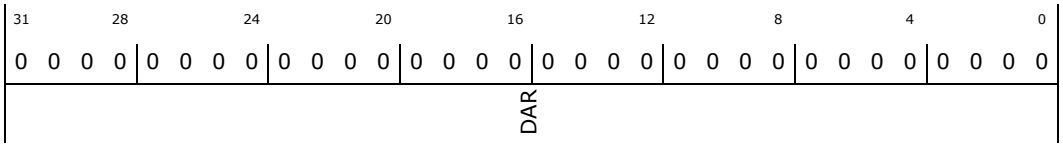
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 218h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.81 reg_LLP_type (LLP6)—Offset 220h

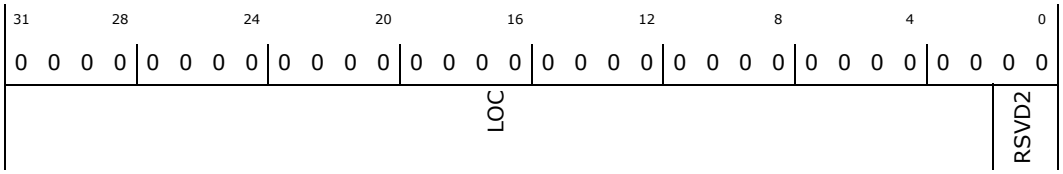
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 220h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.82 reg_CTL_LO_type (CTL_LO6)—Offset 228h

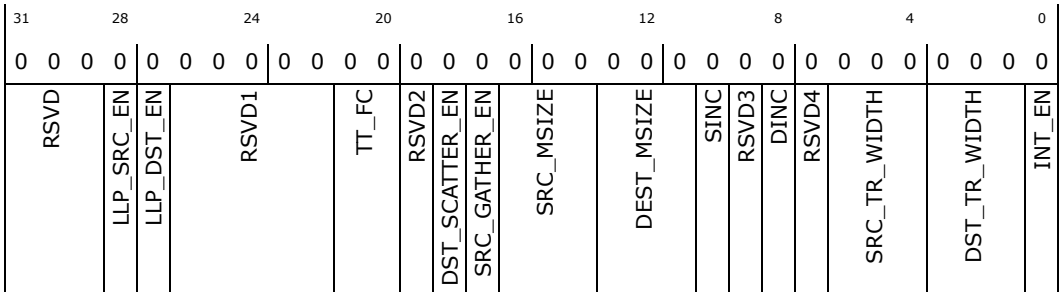
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 228h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.83 reg_CTL_HI_type (CTL_HI6)—Offset 22Ch

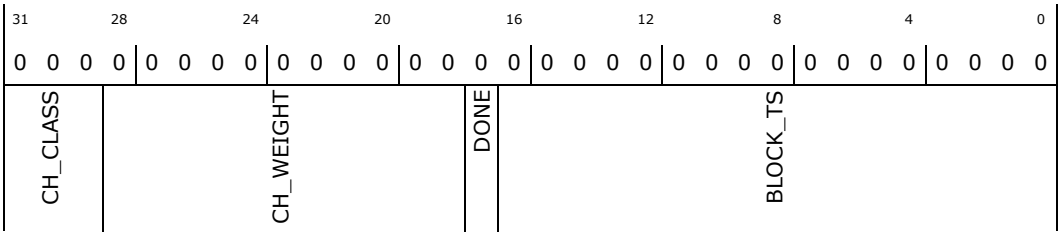
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 22Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.84 reg_SSTAT_type (SSTAT6)—Offset 230h

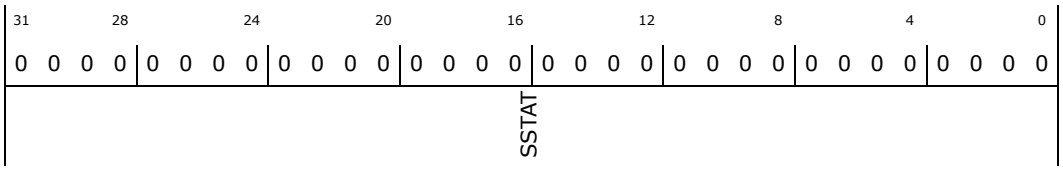
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 230h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.85 reg_DSTAT_type (DSTAT6)—Offset 238h

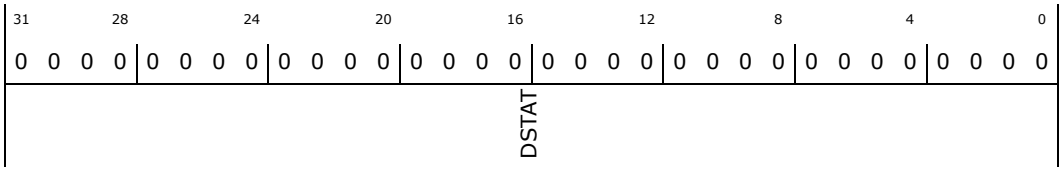
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 238h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.86 reg_SSTATAR_type (SSTATAR6)—Offset 240h

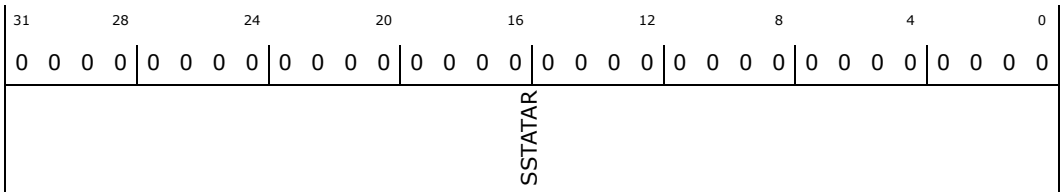
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 240h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.87 reg_DSTATAR_type (DSTATAR6)—Offset 248h

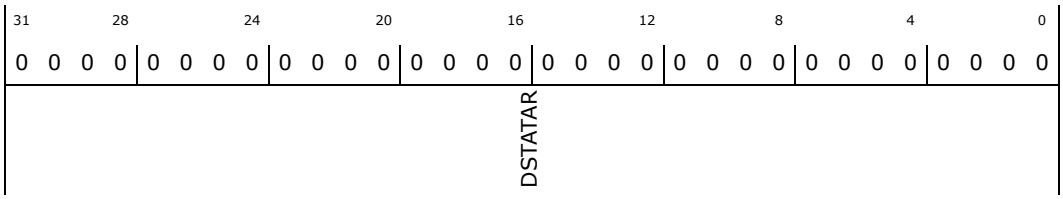
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 248h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.88 reg_CFG_LO_type (CFG_LO6)—Offset 250h

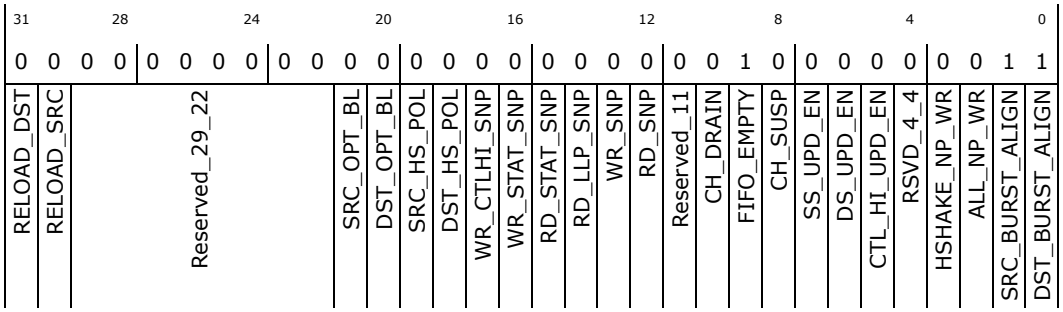
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 250h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.89 reg_CFG_HI_type (CFG_HI6)—Offset 254h

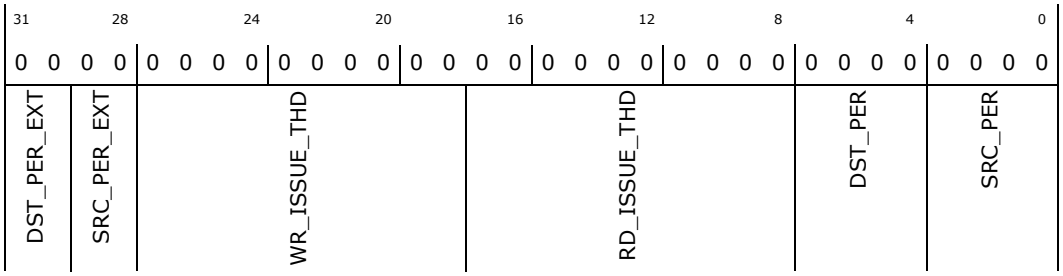
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 254h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.90 reg_SGR_type (SGR6)—Offset 258h

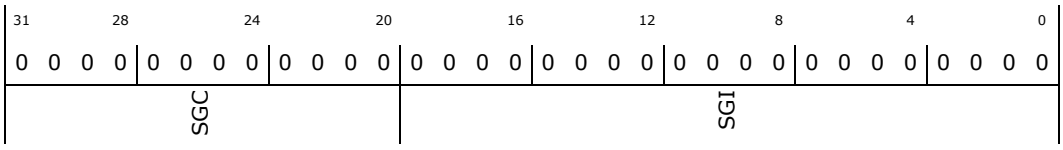
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 258h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.91 reg_DSR_type (DSR6)—Offset 260h

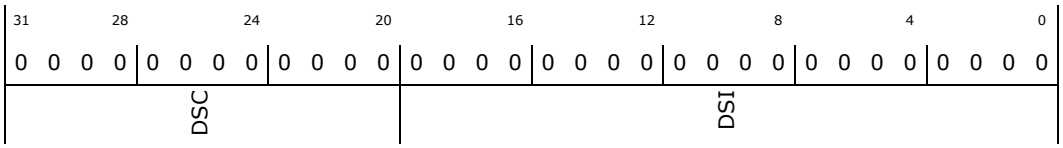
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 260h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.92 reg_SAR_type (SAR7)—Offset 268h

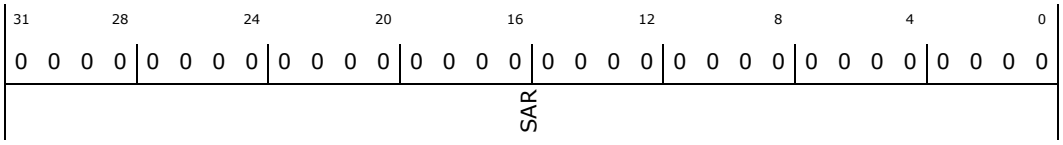
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 268h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.93 reg_DAR_type (DAR7)—Offset 270h

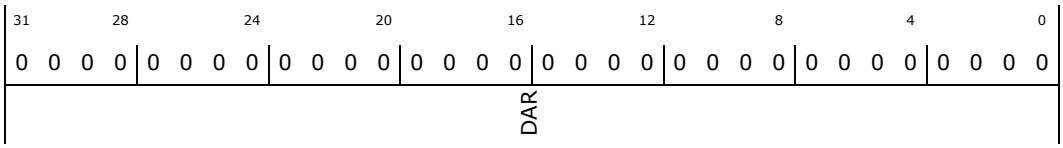
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 270h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.2.94 reg_LLP_type (LLP7)—Offset 278h

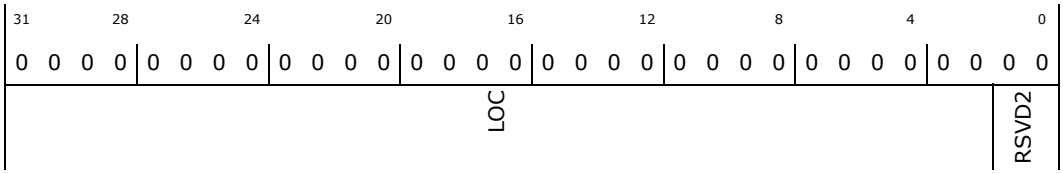
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 278h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.2.95 reg_CTL_LO_type (CTL_LO7)—Offset 280h

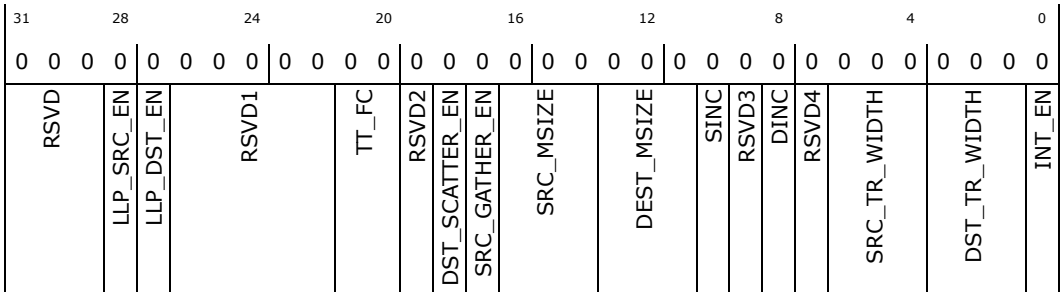
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 280h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.2.96 reg_CTL_HI_type (CTL_HI7)—Offset 284h

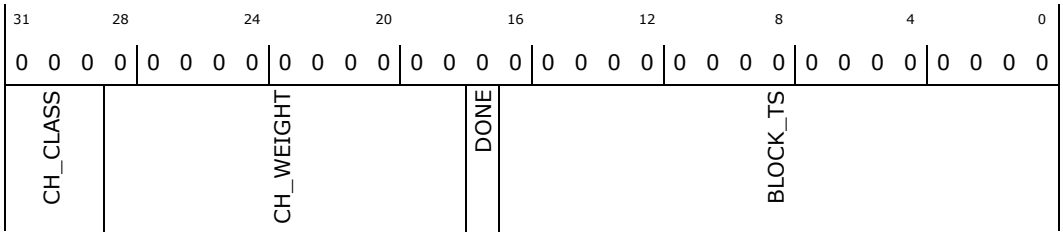
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 284h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.2.97 reg_SSTAT_type (SSTAT7)—Offset 288h

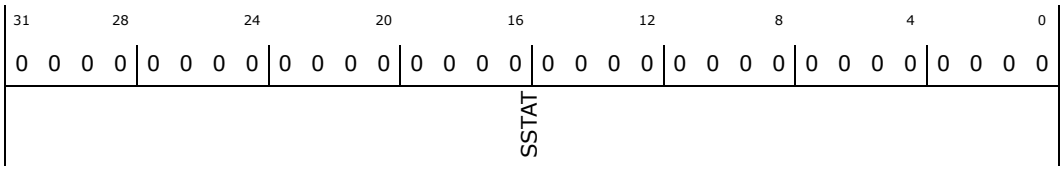
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 288h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.2.98 reg_DSTAT_type (DSTAT7)—Offset 290h

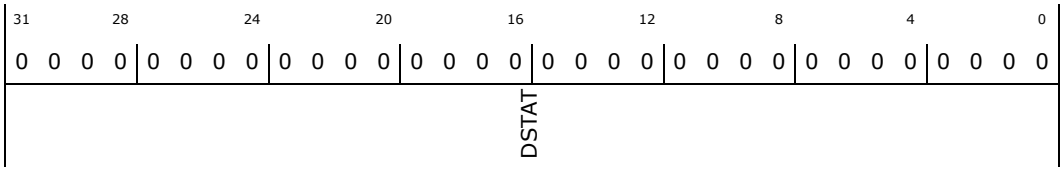
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 290h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.2.99 reg_SSTATAR_type (SSTATAR7)—Offset 298h

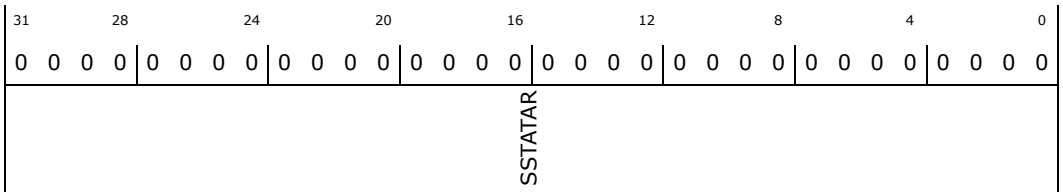
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 298h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.2.100 reg_DSTATAR_type (DSTATAR7)—Offset 2A0h

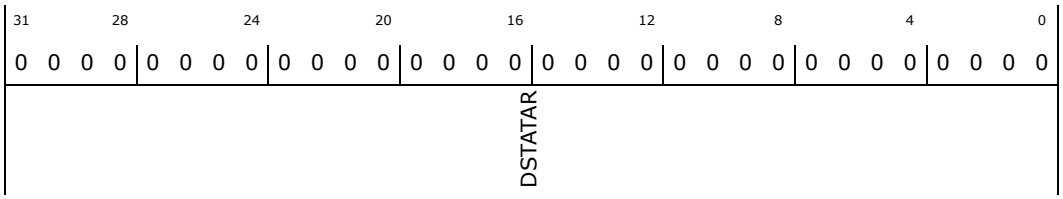
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 2A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.2.101 reg_CFG_LO_type (CFG_LO7)—Offset 2A8h

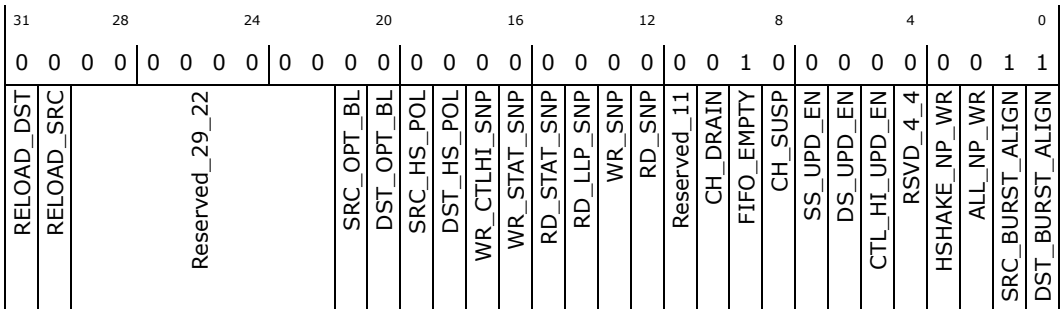
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2A8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.2.102 reg_CFG_HI_type (CFG_HI7)—Offset 2ACh

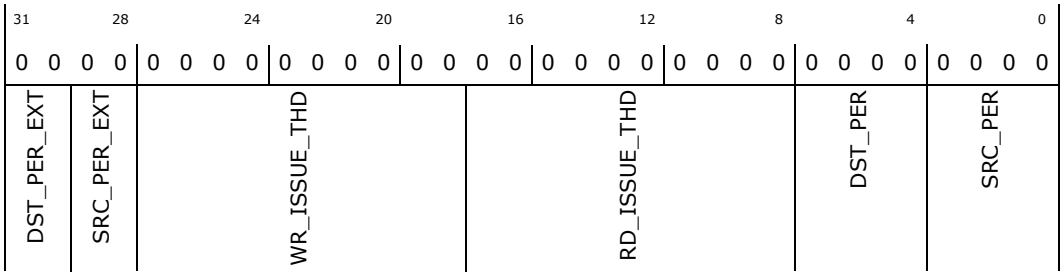
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2ACh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.2.103 reg_SGR_type (SGR7)—Offset 2B0h

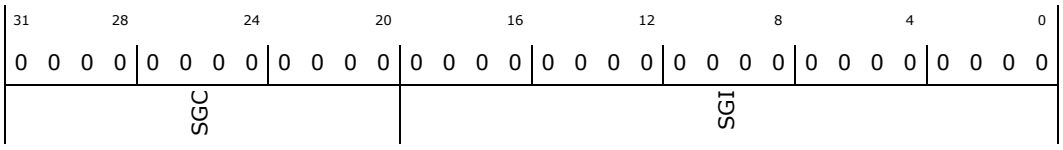
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.2.104 reg_DSR_type (DSR7)—Offset 2B8h

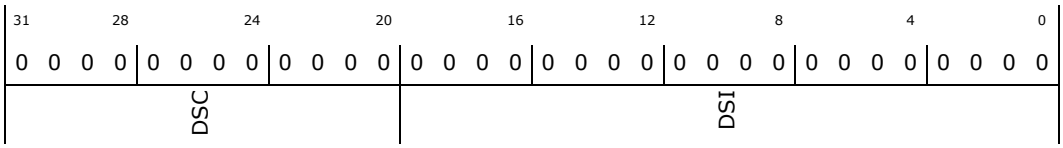
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.2.105 reg_Raw_type (RawTfr)—Offset 2C0h

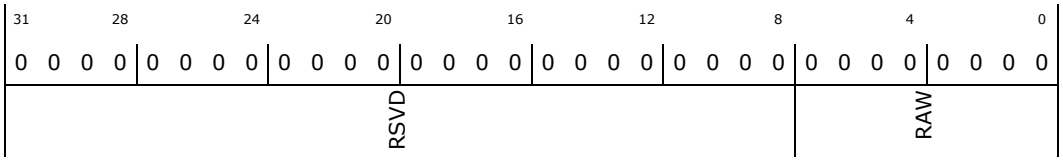
Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.2.106 reg_Raw_type (RawBlock)—Offset 2C8h

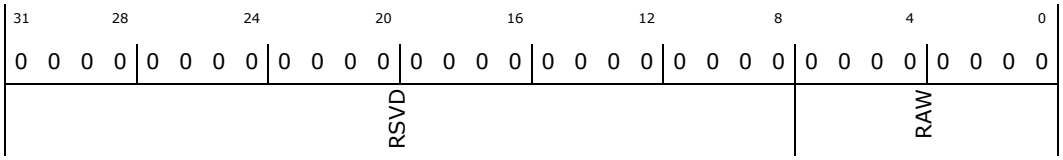
Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.2.107 reg_Raw_type (RawSrcTran)—Offset 2D0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw

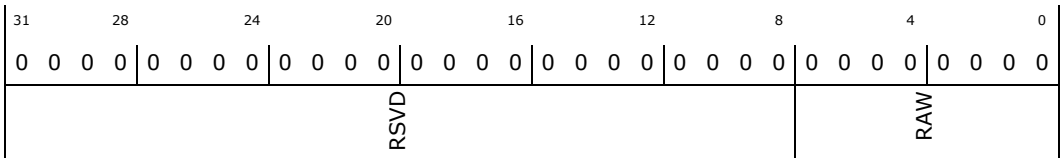
transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**RAW:** Raw interrupt status

8.2.108 reg_Raw_type (RawDstTran)—Offset 2D8h

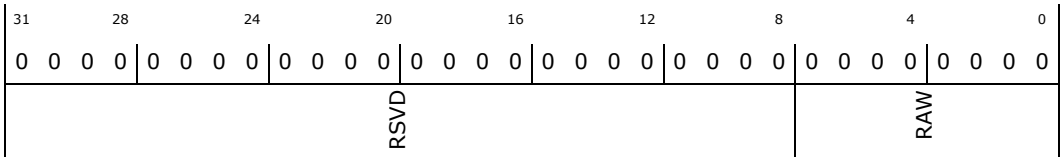
Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 2D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description

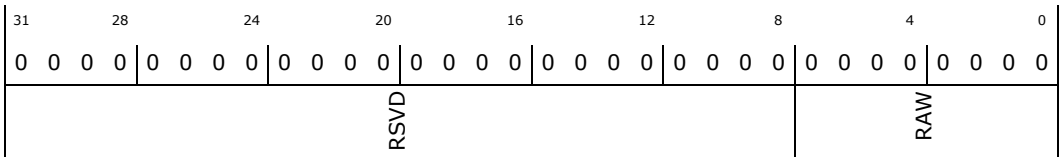
Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**STATUS:** Interrupt status

8.2.115 reg_Mask_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation.

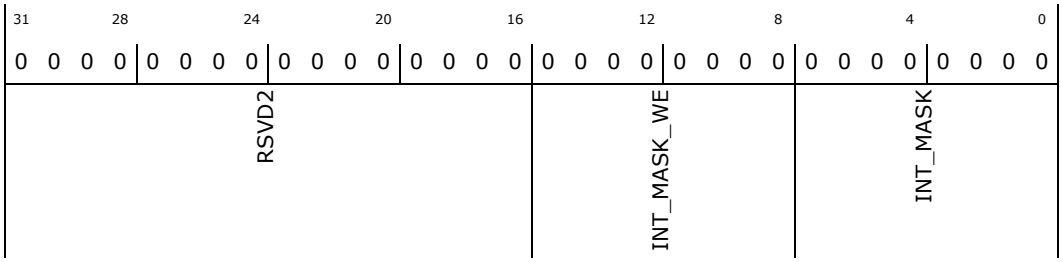
For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 310h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.2.116 reg_Mask_type (MaskBlock)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 318h

1	0x0 RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0x0 RO	**TFR:** OR of the contents of StatusTfr register.

8.2.126 reg_DmaCfgReg_type (DmaCfgReg)—Offset 398h

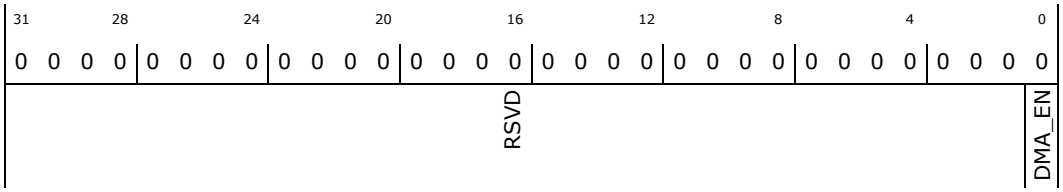
This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 398h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD:** Reserved
0	0x0 RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

8.2.127 reg_ChEnReg_type (ChEnReg)—Offset 3A0h

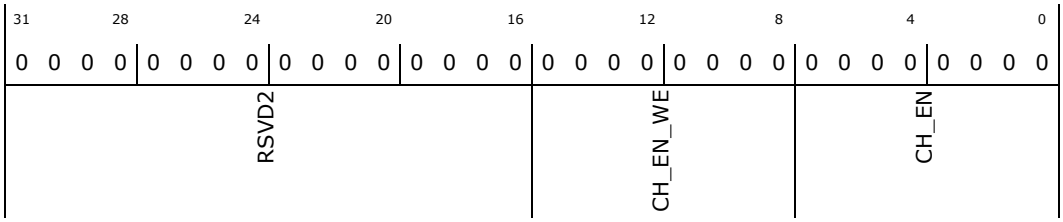
This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 3A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**CH_EN_WE:** Channel enable write enable.
7:0	0x0 RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

8.2.128 reg_CLASS_PRIORITY0_LO_type (ClassPriority0_LO)—Offset 3B8h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 3B8h

Default: 00000000h

12:0	0x0 RW	**PSIZE_CH_0:** Partition Byte Size assigned to Channel 0. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

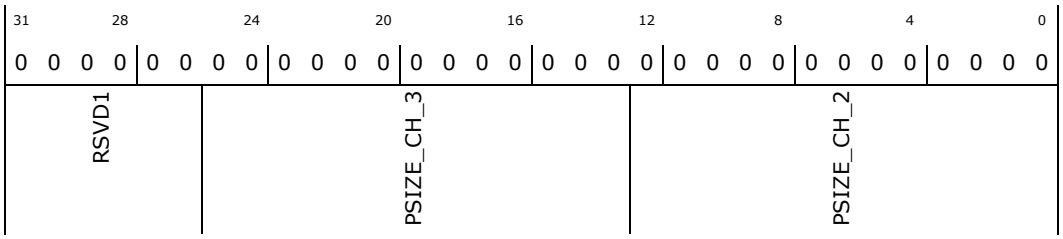
8.2.133 reg_FIFO_PARTITION0_HI_type (FifoPartition0_HI)—Offset 404h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 9C000h] + 404h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_3:** Partition Byte Size assigned to Channel 3. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

Bit Range	Default & Access	Field Name (ID): Description
12:0	0x0 RW	**PSIZE_CH_2:** Partition Byte Size assigned to Channel 2. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

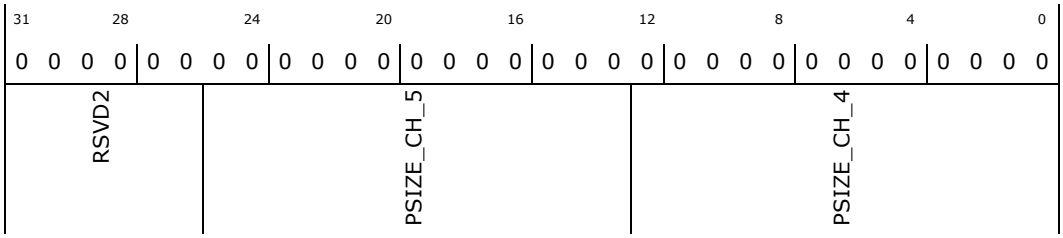
8.2.134 reg_FIFO_PARTITION1_LO_type (FifoPartition1_LO)—Offset 408h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 408h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD2:** Reserved
25:13	0x0 RW	**PSIZE_CH_5:** Partition Byte Size assigned to Channel 5. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_4:** Partition Byte Size assigned to Channel 4. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

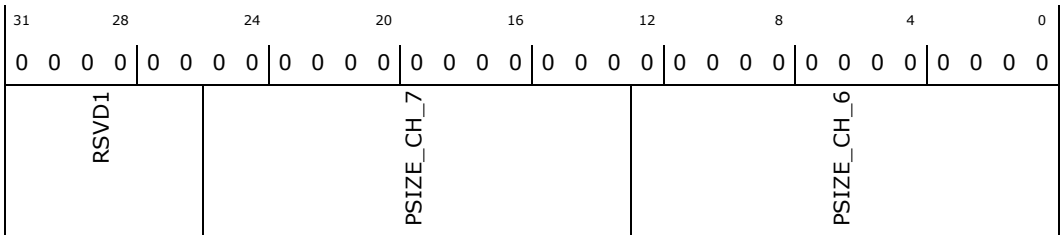
8.2.135 reg_FIFO_PARTITION1_HI_type (FifoPartition1_HI)—Offset 40Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 40Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_7:** Partition Byte Size assigned to Channel 7. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_6:** Partition Byte Size assigned to Channel 6. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

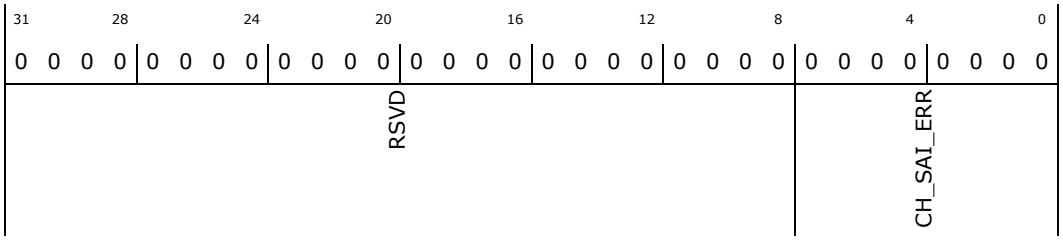
8.2.136 reg_SAI_Error_type (SAI_ERR)—Offset 410h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 410h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**CH_SAI_ERR:** 1: SAI Error occurred on Ch [n] 0: No SAI Error occurred on Ch [n] SAI_ERROR[n] is set by HW on SAI violation for channel [n]. All bits get cleared by SW when reading this register

8.2.137 reg_GLOBAL_CFG_type (GLOBAL_CFG)—Offset 418h

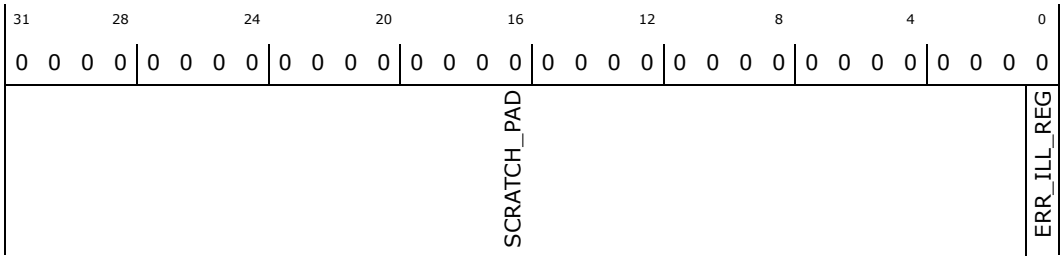
GLOBAL_CFG: GLOBAL DMA Configuration Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 9C000h] + 418h

Default: 00000000h

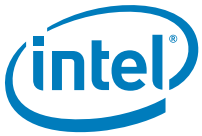


Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future configuration and de-feature bits.
0	0x0 RW	**ERR_ILL_REG:** 0x1 : Issue ERR response on reading illegal (non-existing) registers 0x0 : Issue DVA response on reading illegal (non-existing) registers

8.3 LPE DMA 2 Memory Mapped I/O Registers

Table 54. Summary of DMA 2 Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_SAR_type (SAR0)—Offset 0h" on page 3584	00000000h
8–Bh	4	"reg_DAR_type (DAR0)—Offset 8h" on page 3585	00000000h
10–13h	4	"reg_LLP_type (LLP0)—Offset 10h" on page 3586	00000000h
18–1Bh	4	"reg_CTL_LO_type (CTL_LO0)—Offset 18h" on page 3586	00000000h
1C–1Fh	4	"reg_CTL_HI_type (CTL_HI0)—Offset 1Ch" on page 3588	00000000h
20–23h	4	"reg_SSTAT_type (SSTAT0)—Offset 20h" on page 3590	00000000h
28–2Bh	4	"reg_DSTAT_type (DSTAT0)—Offset 28h" on page 3590	00000000h
30–33h	4	"reg_SSTATAR_type (SSTATAR0)—Offset 30h" on page 3591	00000000h
38–3Bh	4	"reg_DSTATAR_type (DSTATAR0)—Offset 38h" on page 3591	00000000h
40–43h	4	"reg_CFG_LO_type (CFG_LO0)—Offset 40h" on page 3592	00000203h
44–47h	4	"reg_CFG_HI_type (CFG_HI0)—Offset 44h" on page 3594	00000000h
48–4Bh	4	"reg_SGR_type (SGR0)—Offset 48h" on page 3595	00000000h
50–53h	4	"reg_DSR_type (DSR0)—Offset 50h" on page 3596	00000000h
58–5Bh	4	"reg_SAR_type (SAR1)—Offset 58h" on page 3596	00000000h
60–63h	4	"reg_DAR_type (DAR1)—Offset 60h" on page 3597	00000000h
68–6Bh	4	"reg_LLP_type (LLP1)—Offset 68h" on page 3598	00000000h
70–73h	4	"reg_CTL_LO_type (CTL_LO1)—Offset 70h" on page 3599	00000000h
74–77h	4	"reg_CTL_HI_type (CTL_HI1)—Offset 74h" on page 3601	00000000h
78–7Bh	4	"reg_SSTAT_type (SSTAT1)—Offset 78h" on page 3602	00000000h
80–83h	4	"reg_DSTAT_type (DSTAT1)—Offset 80h" on page 3603	00000000h
88–8Bh	4	"reg_SSTATAR_type (SSTATAR1)—Offset 88h" on page 3604	00000000h
90–93h	4	"reg_DSTATAR_type (DSTATAR1)—Offset 90h" on page 3604	00000000h
98–9Bh	4	"reg_CFG_LO_type (CFG_LO1)—Offset 98h" on page 3605	00000203h
9C–9Fh	4	"reg_CFG_HI_type (CFG_HI1)—Offset 9Ch" on page 3607	00000000h
A0–A3h	4	"reg_SGR_type (SGR1)—Offset A0h" on page 3608	00000000h
A8–ABh	4	"reg_DSR_type (DSR1)—Offset A8h" on page 3609	00000000h
B0–B3h	4	"reg_SAR_type (SAR2)—Offset B0h" on page 3609	00000000h
B8–BBh	4	"reg_DAR_type (DAR2)—Offset B8h" on page 3610	00000000h
C0–C3h	4	"reg_LLP_type (LLP2)—Offset C0h" on page 3611	00000000h
C8–CBh	4	"reg_CTL_LO_type (CTL_LO2)—Offset C8h" on page 3612	00000000h
CC–CFh	4	"reg_CTL_HI_type (CTL_HI2)—Offset CCh" on page 3614	00000000h
D0–D3h	4	"reg_SSTAT_type (SSTAT2)—Offset D0h" on page 3615	00000000h
D8–DBh	4	"reg_DSTAT_type (DSTAT2)—Offset D8h" on page 3616	00000000h
E0–E3h	4	"reg_SSTATAR_type (SSTATAR2)—Offset E0h" on page 3617	00000000h



Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
E8–EBh	4	"reg_DSTATAR_type (DSTATAR2)—Offset E8h" on page 3617	00000000h
F0–F3h	4	"reg_CFG_LO_type (CFG_LO2)—Offset F0h" on page 3618	00000203h
F4–F7h	4	"reg_CFG_HI_type (CFG_HI2)—Offset F4h" on page 3620	00000000h
F8–FBh	4	"reg_SGR_type (SGR2)—Offset F8h" on page 3621	00000000h
100–103h	4	"reg_DSR_type (DSR2)—Offset 100h" on page 3622	00000000h
108–10Bh	4	"reg_SAR_type (SAR3)—Offset 108h" on page 3622	00000000h
110–113h	4	"reg_DAR_type (DAR3)—Offset 110h" on page 3623	00000000h
118–11Bh	4	"reg_LLP_type (LLP3)—Offset 118h" on page 3624	00000000h
120–123h	4	"reg_CTL_LO_type (CTL_LO3)—Offset 120h" on page 3625	00000000h
124–127h	4	"reg_CTL_HI_type (CTL_HI3)—Offset 124h" on page 3627	00000000h
128–12Bh	4	"reg_SSTAT_type (SSTAT3)—Offset 128h" on page 3628	00000000h
130–133h	4	"reg_DSTAT_type (DSTAT3)—Offset 130h" on page 3629	00000000h
138–13Bh	4	"reg_SSTATAR_type (SSTATAR3)—Offset 138h" on page 3630	00000000h
140–143h	4	"reg_DSTATAR_type (DSTATAR3)—Offset 140h" on page 3630	00000000h
148–14Bh	4	"reg_CFG_LO_type (CFG_LO3)—Offset 148h" on page 3631	00000203h
14C–14Fh	4	"reg_CFG_HI_type (CFG_HI3)—Offset 14Ch" on page 3633	00000000h
150–153h	4	"reg_SGR_type (SGR3)—Offset 150h" on page 3634	00000000h
158–15Bh	4	"reg_DSR_type (DSR3)—Offset 158h" on page 3635	00000000h

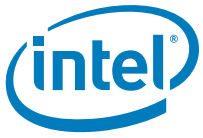
3C0–3C3h	4	"reg_CLASS_PRIORITY1_LO_type (ClassPriority1_LO)—Offset 3C0h" on page 3704	00000000h
3C4–3C7h	4	"reg_CLASS_PRIORITY1_HI_type (ClassPriority1_HI)—Offset 3C4h" on page 3705	00000000h
400–403h	4	"reg_FIFO_PARTITION0_LO_type (FifoPartition0_LO)—Offset 400h" on page 3705	00000000h
404–407h	4	"reg_FIFO_PARTITION0_HI_type (FifoPartition0_HI)—Offset 404h" on page 3706	00000000h
408–40Bh	4	"reg_FIFO_PARTITION1_LO_type (FifoPartition1_LO)—Offset 408h" on page 3707	00000000h
40C–40Fh	4	"reg_FIFO_PARTITION1_HI_type (FifoPartition1_HI)—Offset 40Ch" on page 3707	00000000h
410–413h	4	"reg_SAI_Error_type (SAI_ERR)—Offset 410h" on page 3708	00000000h
418–41Bh	4	"reg_GLOBAL_CFG_type (GLOBAL_CFG)—Offset 418h" on page 3708	00000000h



8.3.1 reg_SAR_type (SAR0)—Offset 0h

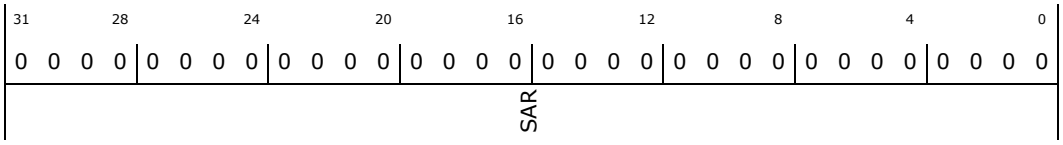
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.2 reg_DAR_type (DAR0)—Offset 8h

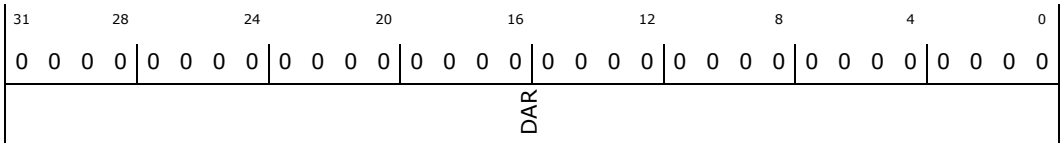
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

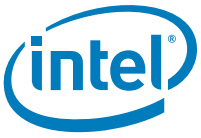
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported



8.3.3 reg_LLP_type (LLP0)—Offset 10h

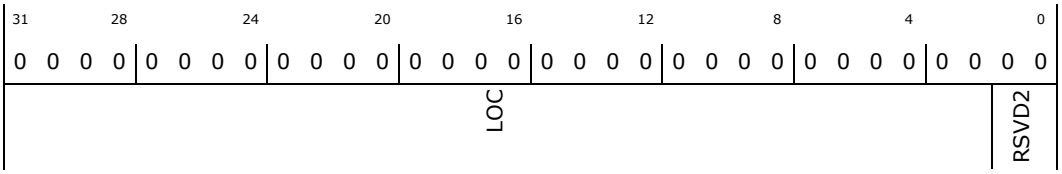
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

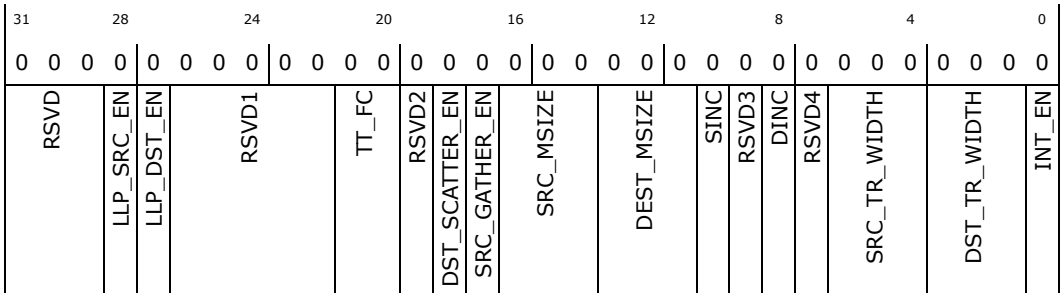
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.

Bit Range	Default & Access	Field Name (ID): Description
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.5 reg_CTL_HI_type (CTL_HI0)—Offset 1Ch

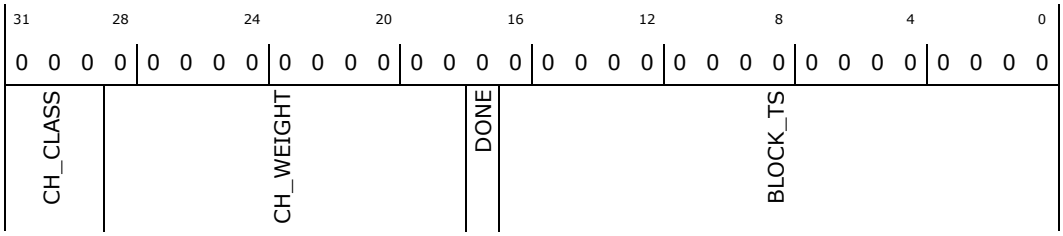
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.6 reg_SSTAT_type (SSTAT0)—Offset 20h

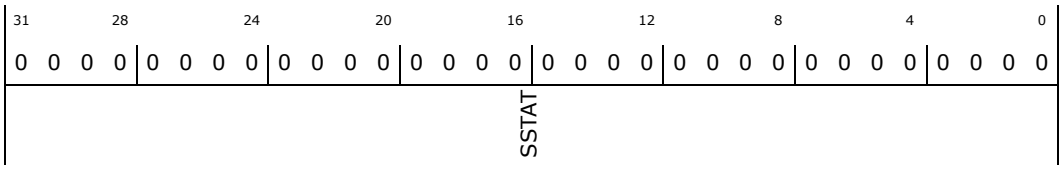
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 20h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.7 reg_DSTAT_type (DSTAT0)—Offset 28h

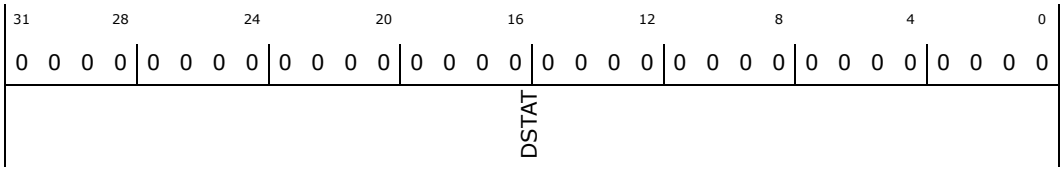
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

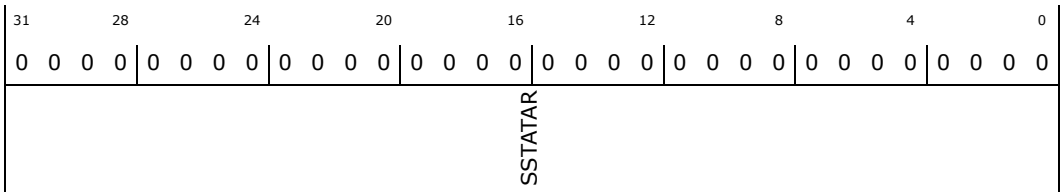
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

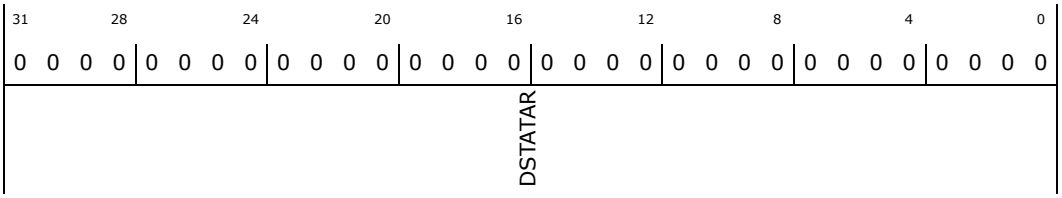
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

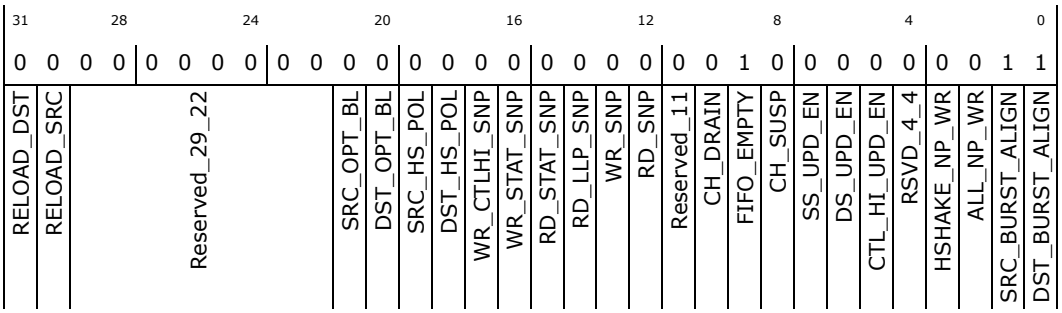
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 40h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.11 reg_CFG_HI_type (CFG_HI0)—Offset 44h

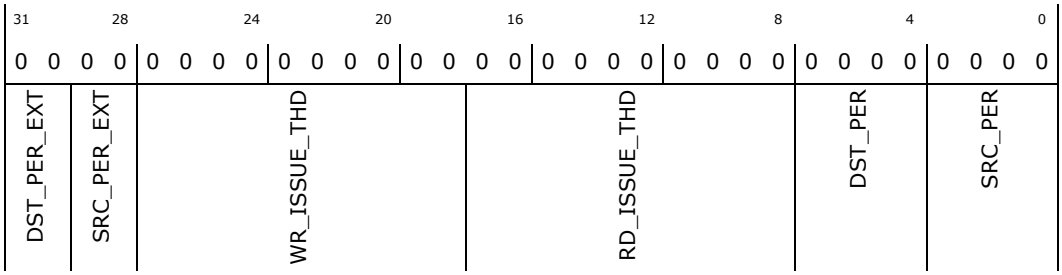
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 44h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.

Bit Range	Default & Access	Field Name (ID): Description
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.12 reg_SGR_type (SGR0)—Offset 48h

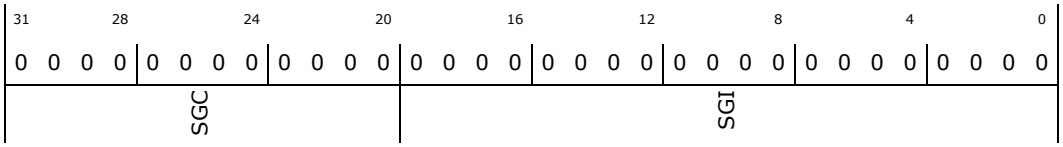
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 48h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.13 reg_DSR_type (DSR0)—Offset 50h

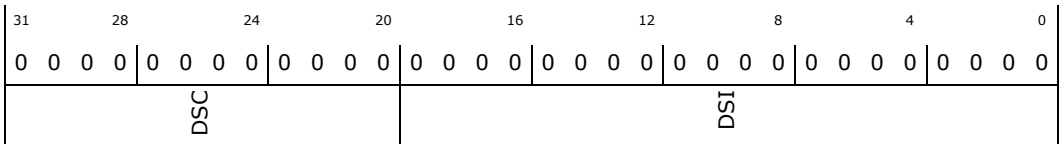
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 50h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.14 reg_SAR_type (SAR1)—Offset 58h

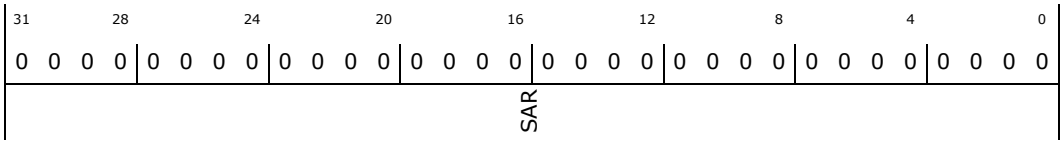
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 58h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.15 reg_DAR_type (DAR1)—Offset 60h

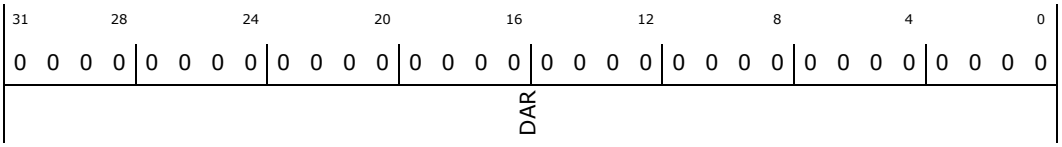
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 60h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.16 reg_LLP_type (LLP1)—Offset 68h

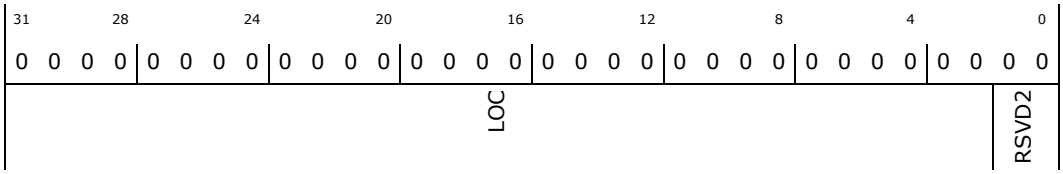
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 68h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.17 reg_CTL_LO_type (CTL_LO1)—Offset 70h

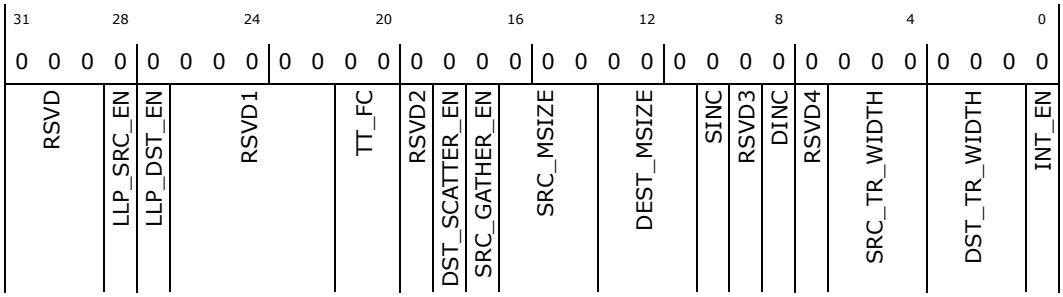
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

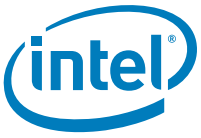
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 70h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)



Bit Range	Default & Access	Field Name (ID): Description
26:22	0x0 RO	**RSVD1:** RSVD
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.18 reg_CTL_HI_type (CTL_HI1)—Offset 74h

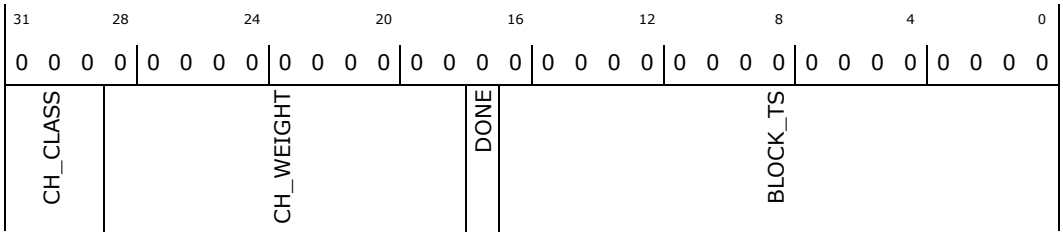
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.19 reg_SSTAT_type (SSTAT1)—Offset 78h

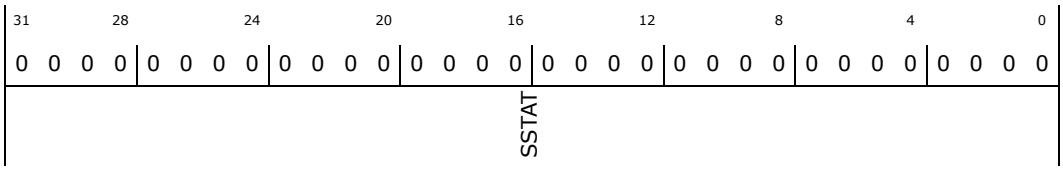
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.20 reg_DSTAT_type (DSTAT1)—Offset 80h

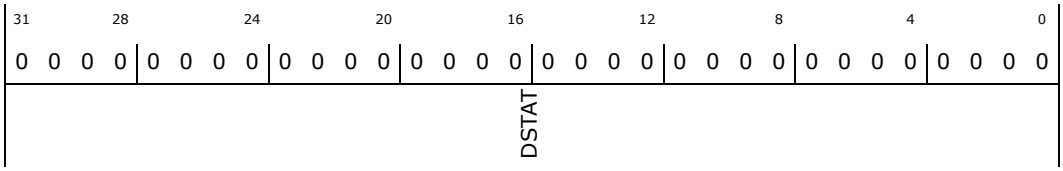
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 80h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.21 reg_SSTATAR_type (SSTATAR1)—Offset 88h

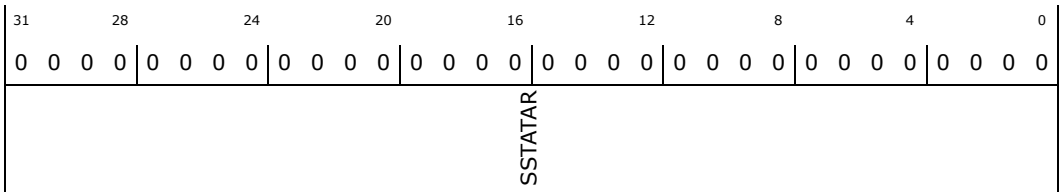
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 88h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.22 reg_DSTATAR_type (DSTATAR1)—Offset 90h

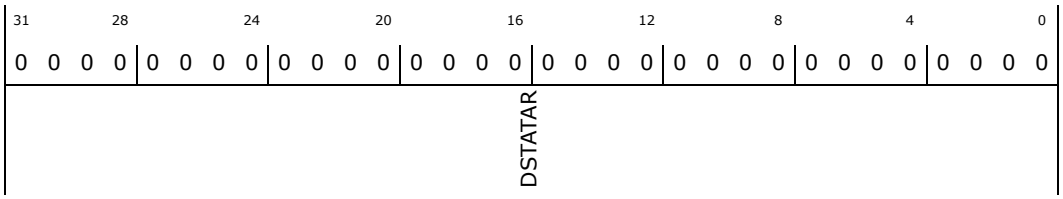
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 90h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.23 reg_CFG_LO_type (CFG_LO1)—Offset 98h

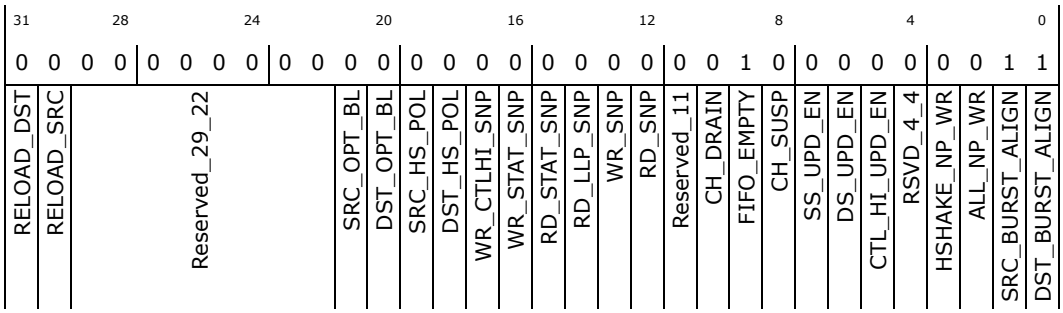
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 98h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.24 reg_CFG_HI_type (CFG_HI1)—Offset 9Ch

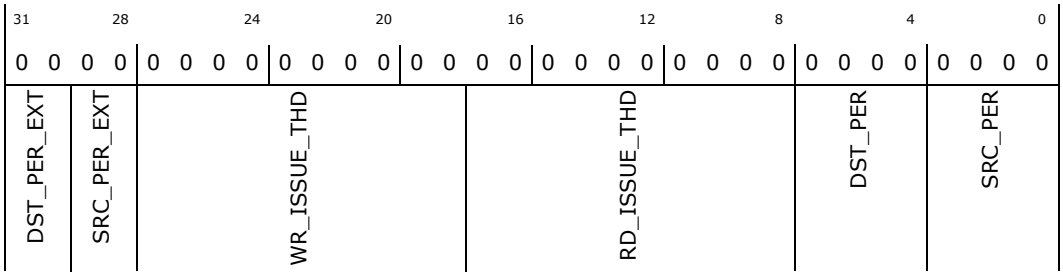
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 9Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.25 reg_SGR_type (SGR1)—Offset A0h

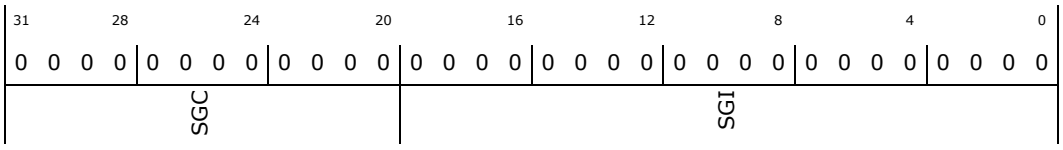
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.26 reg_DSR_type (DSR1)—Offset A8h

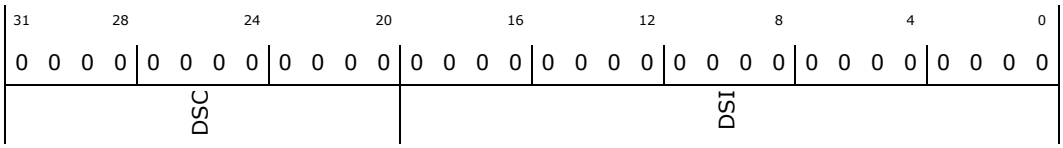
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.27 reg_SAR_type (SAR2)—Offset B0h

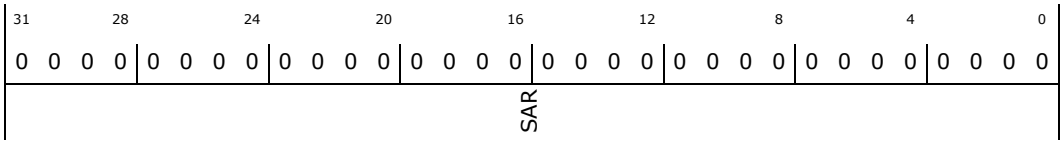
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.28 reg_DAR_type (DAR2)—Offset B8h

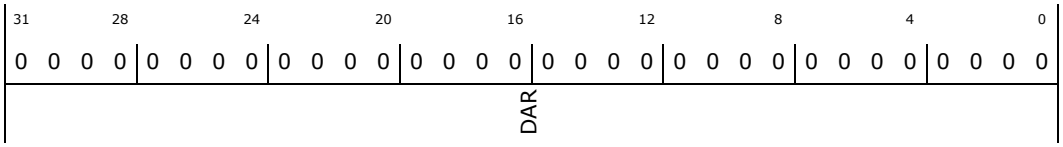
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.29 reg_LLP_type (LLP2)—Offset C0h

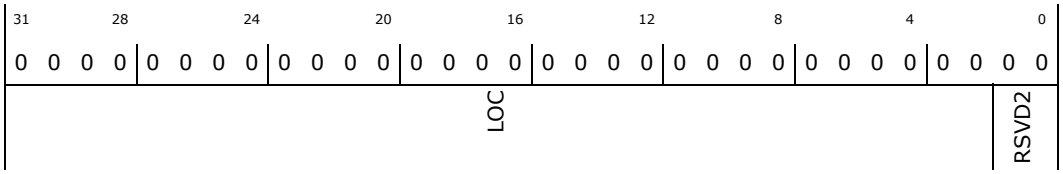
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

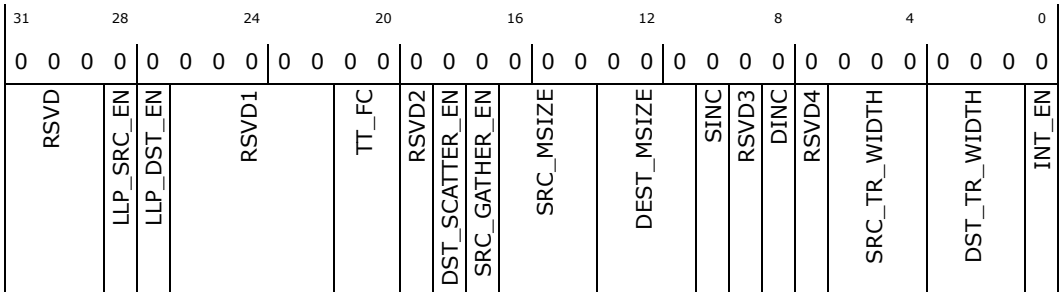
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.31 reg_CTL_HI_type (CTL_HI2)—Offset CCh

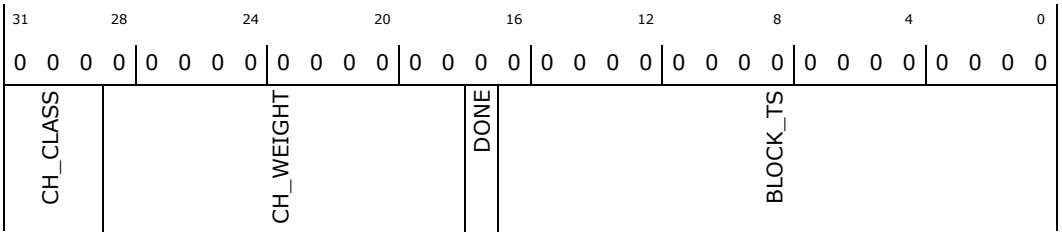
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + CCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.32 reg_SSTAT_type (SSTAT2)—Offset D0h

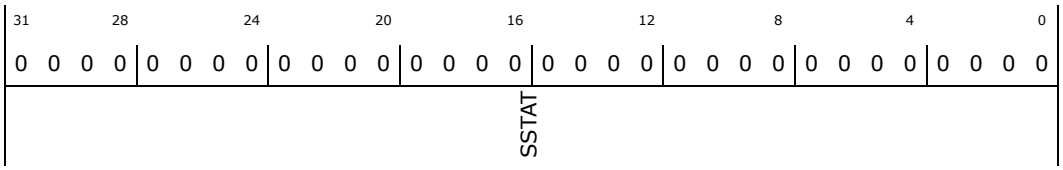
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.33 reg_DSTAT_type (DSTAT2)—Offset D8h

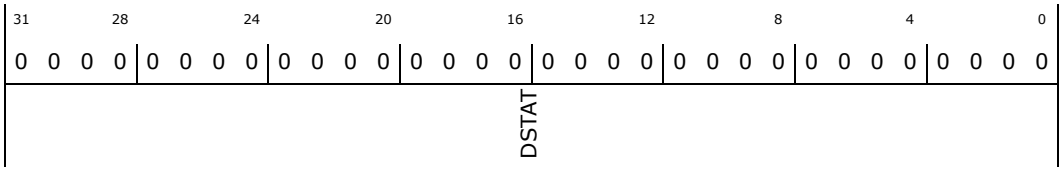
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.34 reg_SSTATAR_type (SSTATAR2)—Offset E0h

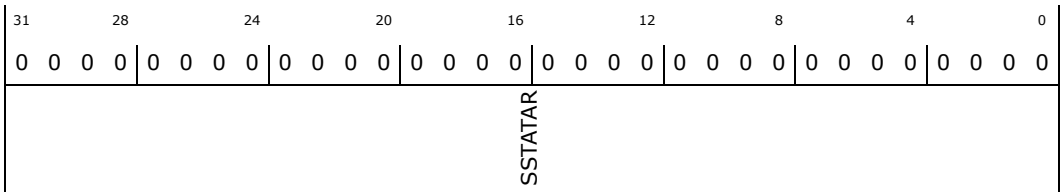
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.35 reg_DSTATAR_type (DSTATAR2)—Offset E8h

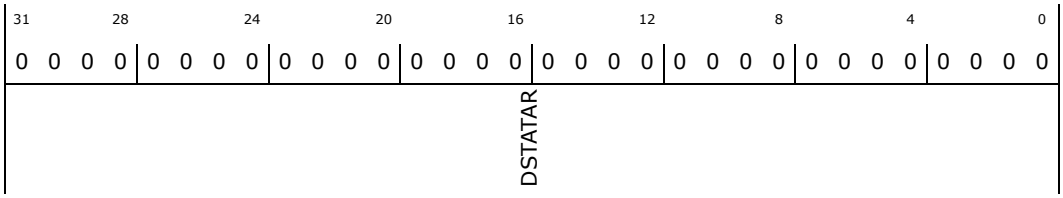
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.36 reg_CFG_LO_type (CFG_LO2)—Offset F0h

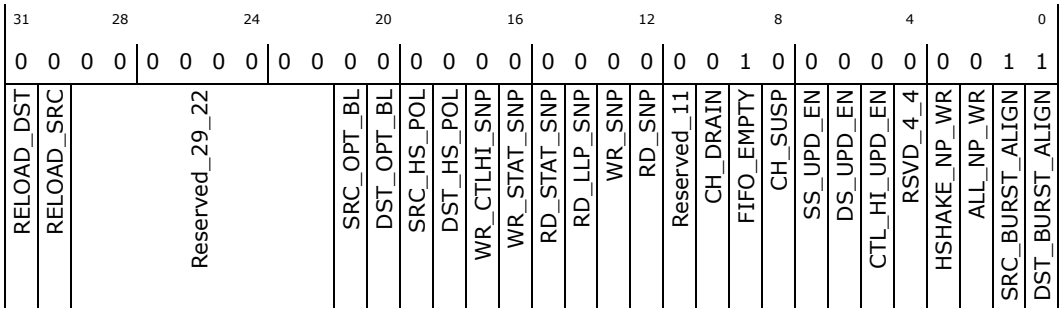
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + F0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.37 reg_CFG_HI_type (CFG_HI2)—Offset F4h

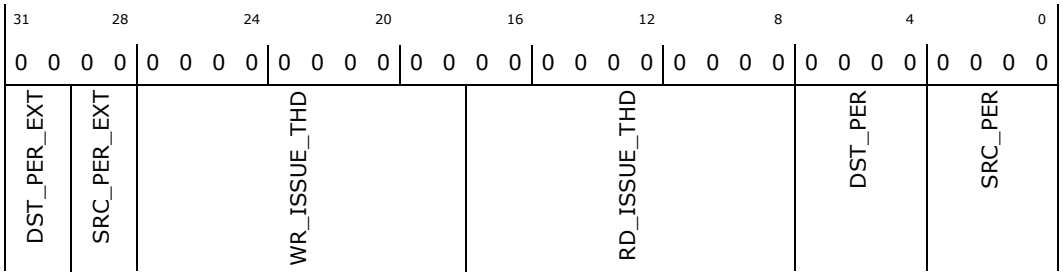
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + F4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.38 reg_SGR_type (SGR2)—Offset F8h

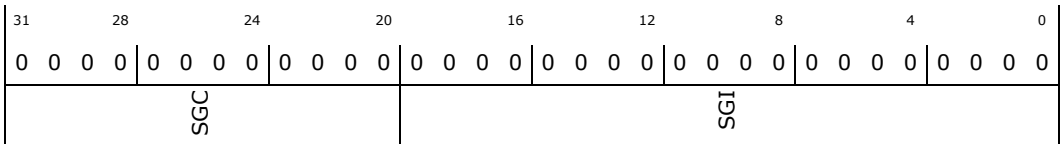
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + F8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.39 reg_DSR_type (DSR2)—Offset 100h

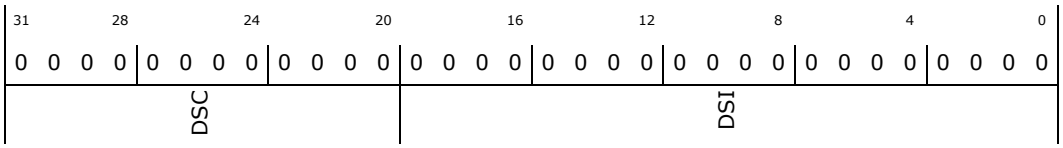
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 100h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.40 reg_SAR_type (SAR3)—Offset 108h

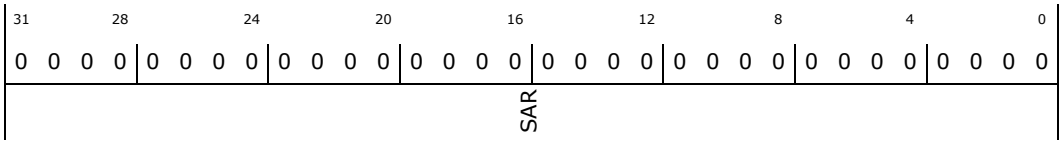
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 108h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.41 reg_DAR_type (DAR3)—Offset 110h

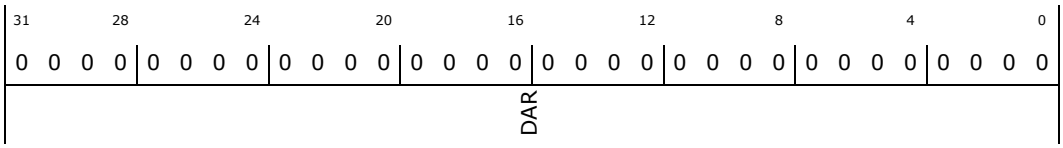
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 110h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.42 reg_LLP_type (LLP3)—Offset 118h

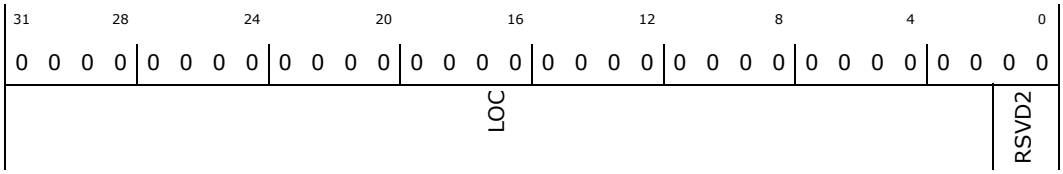
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 118h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.43 reg_CTL_LO_type (CTL_LO3)—Offset 120h

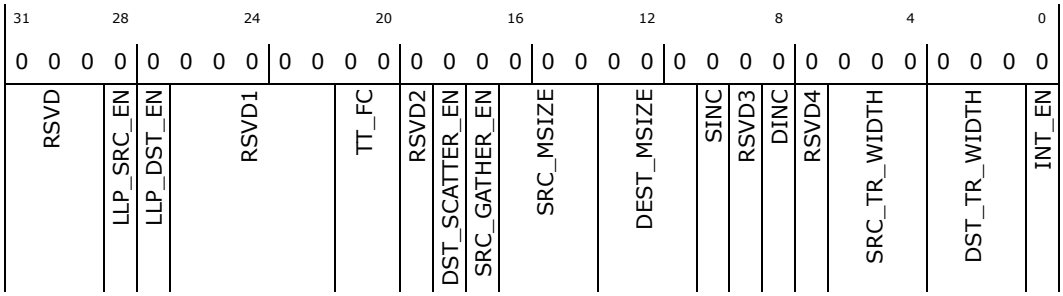
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 120h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.44 reg_CTL_HI_type (CTL_HI3)—Offset 124h

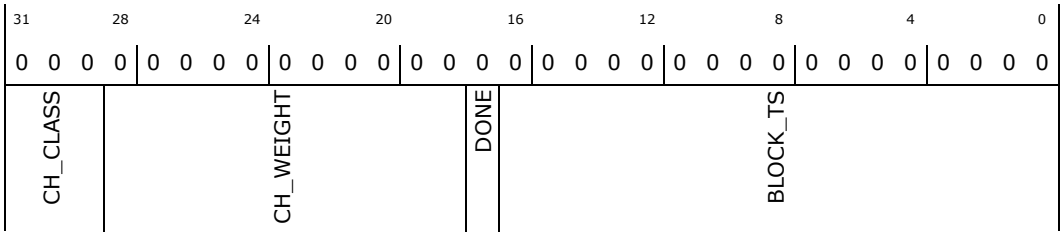
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

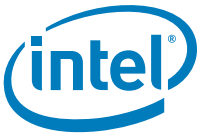
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 124h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.45 reg_SSTAT_type (SSTAT3)—Offset 128h

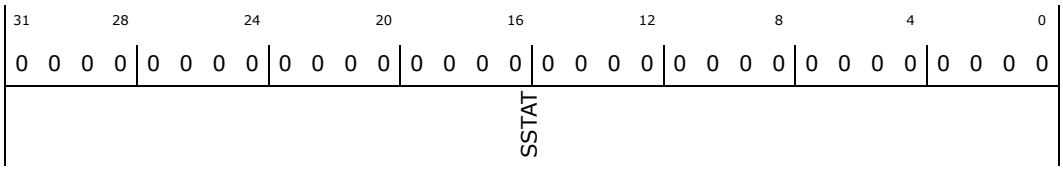
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 128h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.46 reg_DSTAT_type (DSTAT3)—Offset 130h

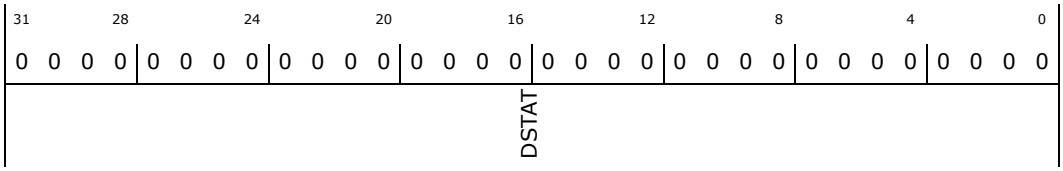
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 130h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.47 reg_SSTATAR_type (SSTATAR3)—Offset 138h

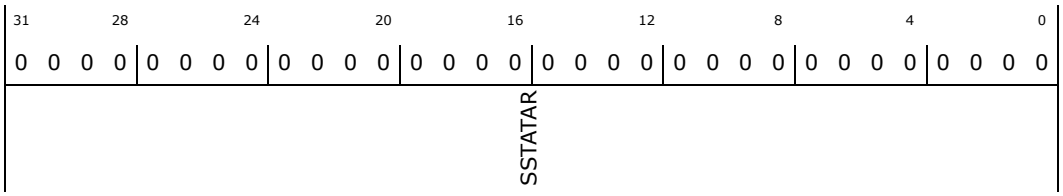
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 138h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.48 reg_DSTATAR_type (DSTATAR3)—Offset 140h

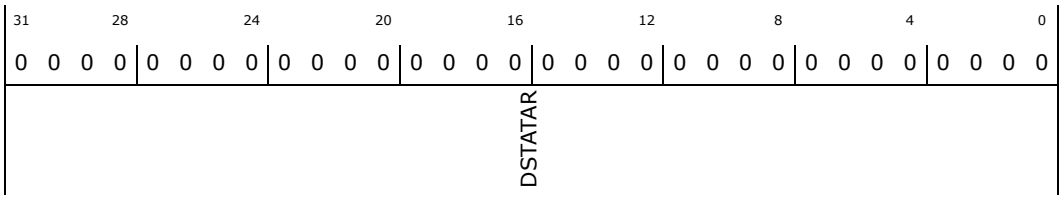
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 140h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.49 reg_CFG_LO_type (CFG_LO3)—Offset 148h

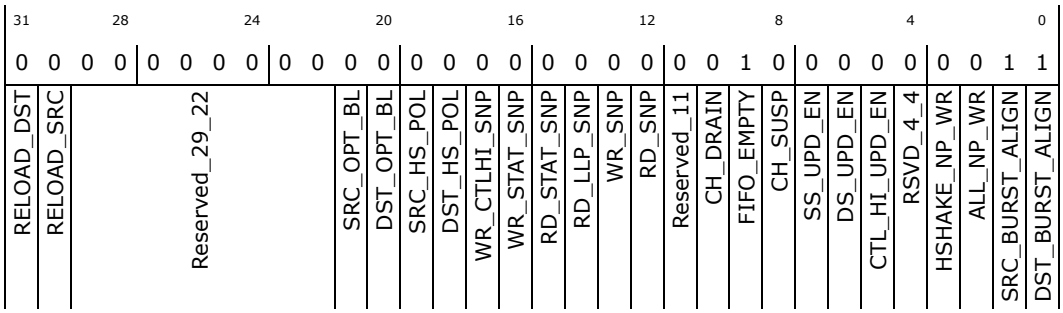
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 148h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.50 reg_CFG_HI_type (CFG_HI3)—Offset 14Ch

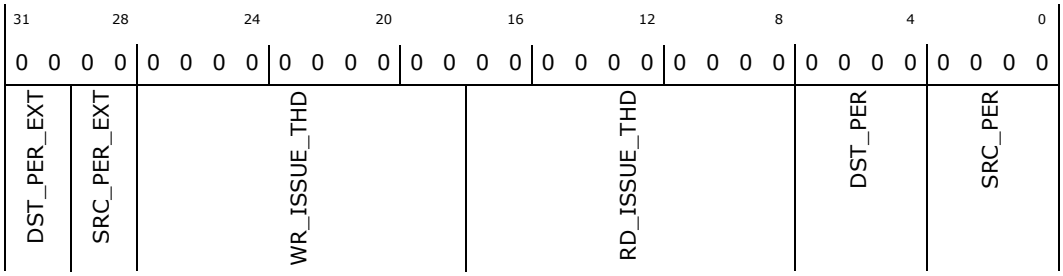
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 14Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.51 reg_SGR_type (SGR3)—Offset 150h

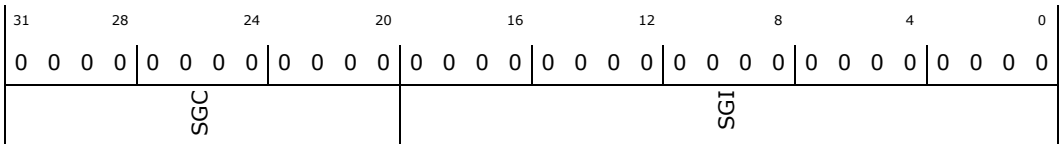
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 150h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.52 reg_DSR_type (DSR3)—Offset 158h

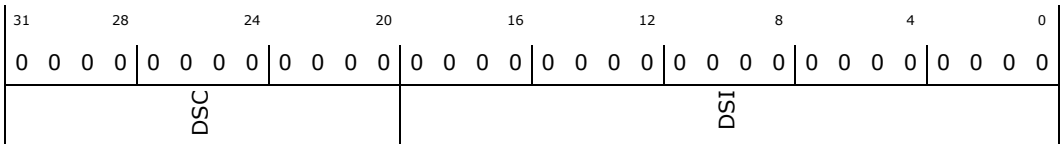
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 158h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.53 reg_SAR_type (SAR4)—Offset 160h

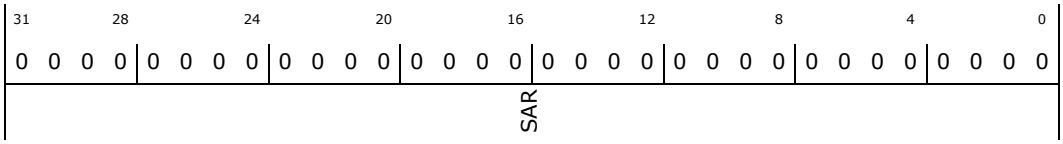
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 160h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.54 reg_DAR_type (DAR4)—Offset 168h

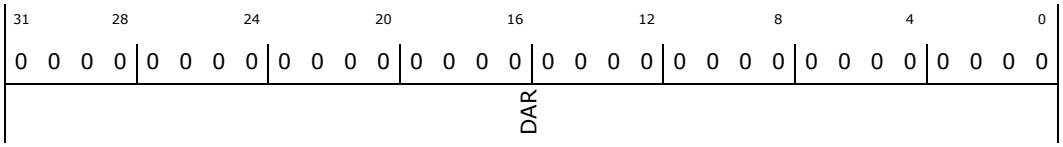
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 168h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.55 reg_LLP_type (LLP4)—Offset 170h

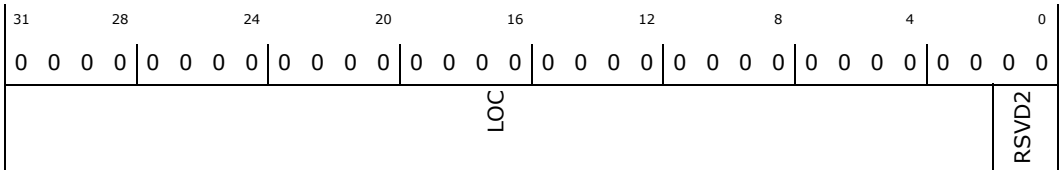
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 170h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

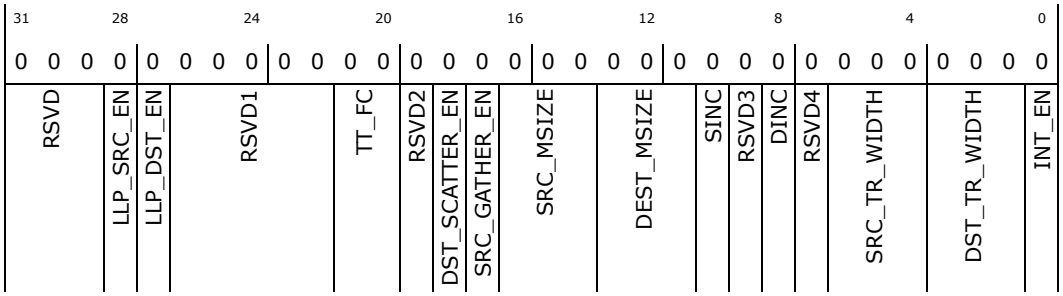
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 178h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.57 reg_CTL_HI_type (CTL_HI4)—Offset 17Ch

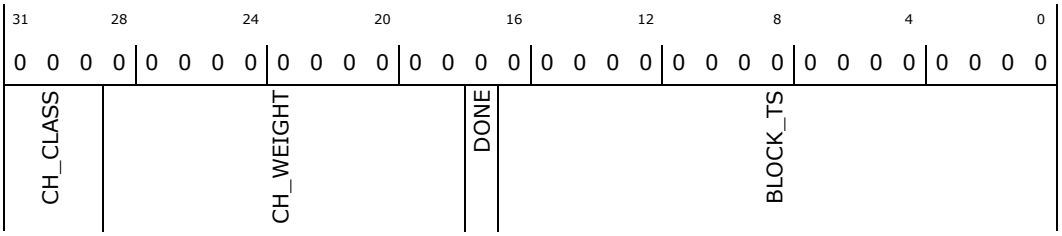
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 17Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.58 reg_SSTAT_type (SSTAT4)—Offset 180h

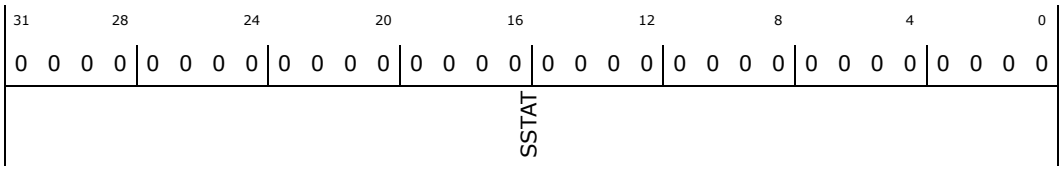
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 180h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.59 reg_DSTAT_type (DSTAT4)—Offset 188h

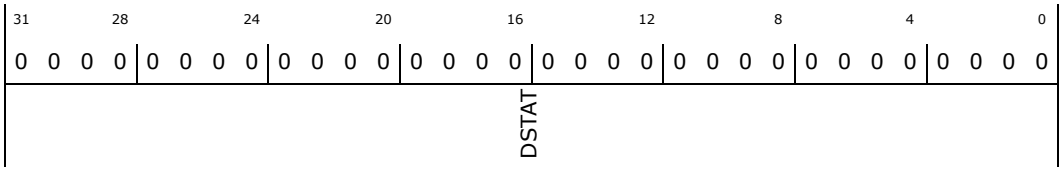
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 188h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.60 reg_SSTATAR_type (SSTATAR4)—Offset 190h

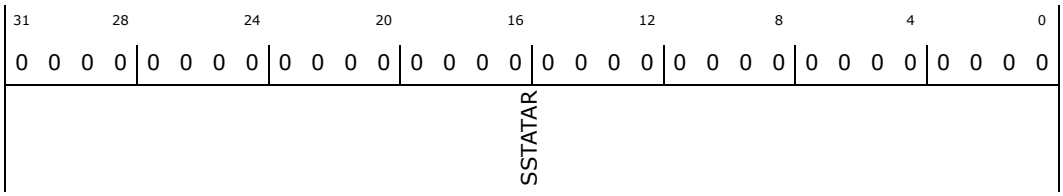
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 190h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.61 reg_DSTATAR_type (DSTATAR4)—Offset 198h

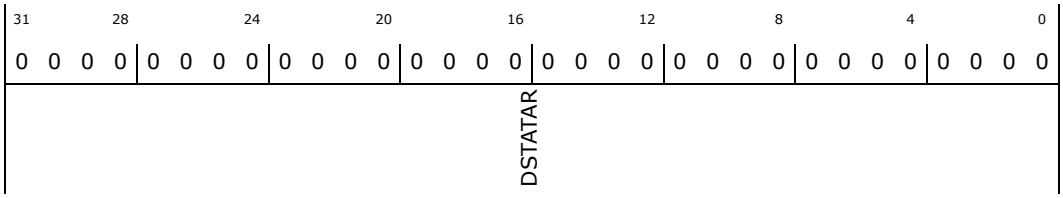
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 198h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.62 reg_CFG_LO_type (CFG_LO4)—Offset 1A0h

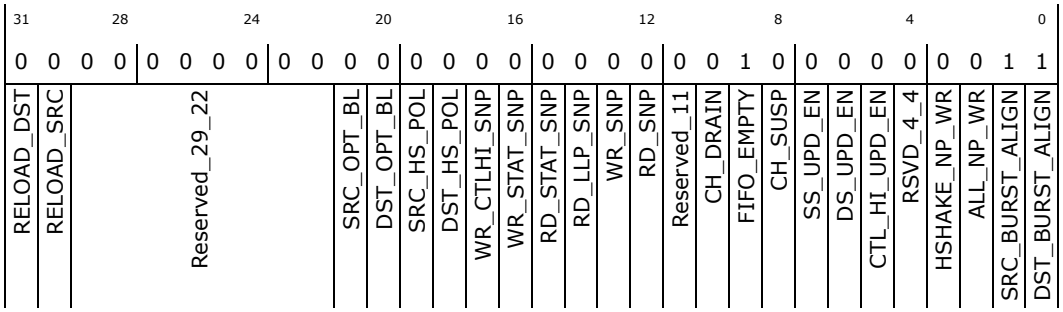
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1A0h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.63 reg_CFG_HI_type (CFG_HI4)—Offset 1A4h

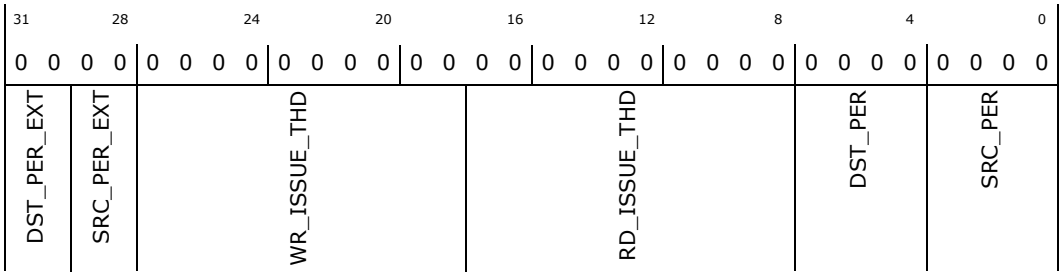
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1A4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.64 reg_SGR_type (SGR4)—Offset 1A8h

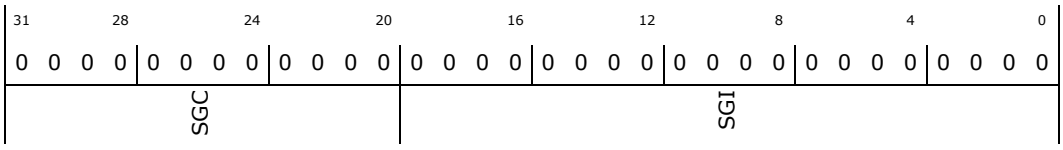
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1A8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.65 reg_DSR_type (DSR4)—Offset 1B0h

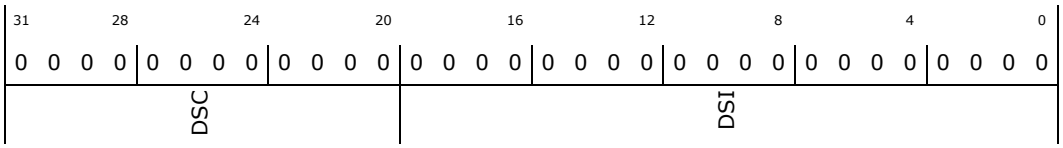
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.66 reg_SAR_type (SAR5)—Offset 1B8h

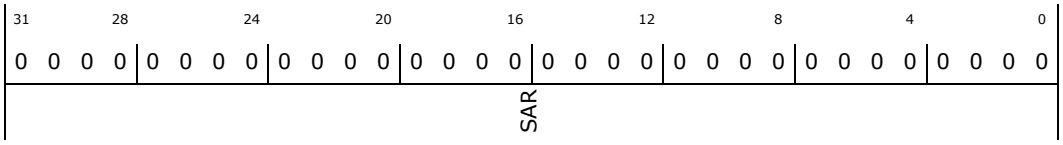
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.67 reg_DAR_type (DAR5)—Offset 1C0h

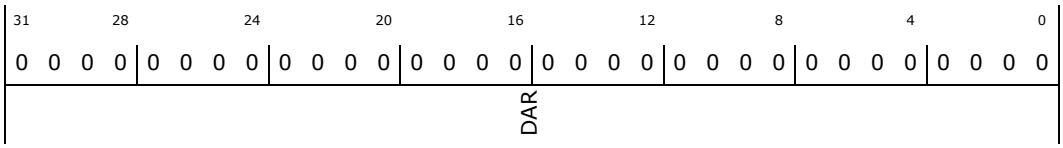
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.68 reg_LLP_type (LLP5)—Offset 1C8h

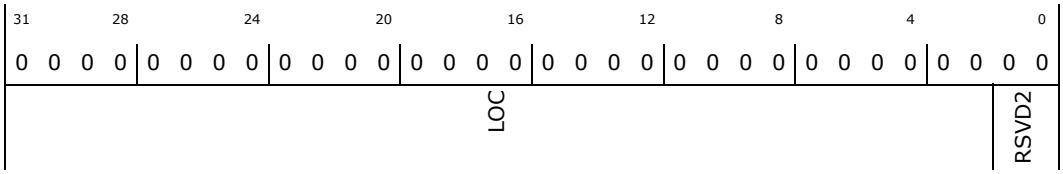
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1C8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.69 reg_CTL_LO_type (CTL_LO5)—Offset 1D0h

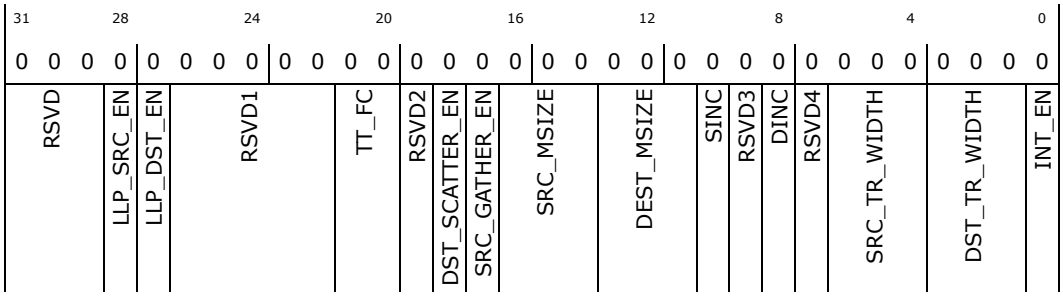
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1D0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.70 reg_CTL_HI_type (CTL_HI5)—Offset 1D4h

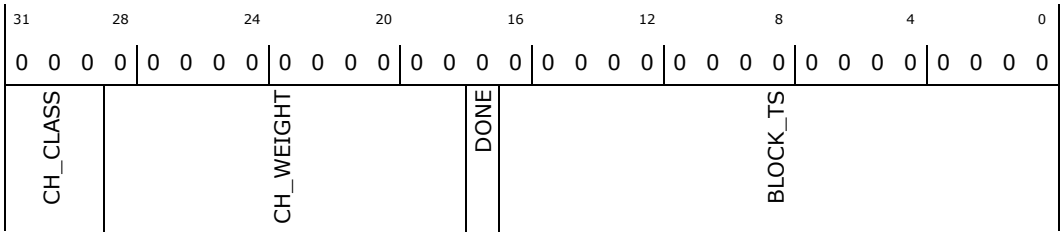
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1D4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.71 reg_SSTAT_type (SSTAT5)—Offset 1D8h

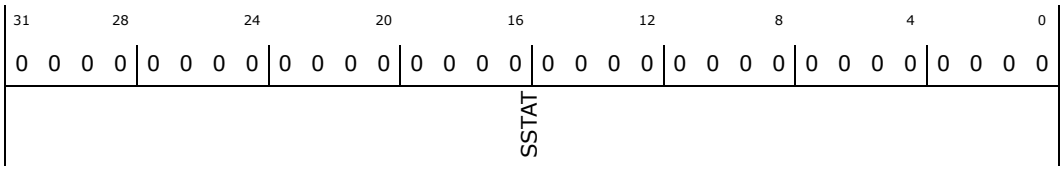
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1D8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.72 reg_DSTAT_type (DSTAT5)—Offset 1E0h

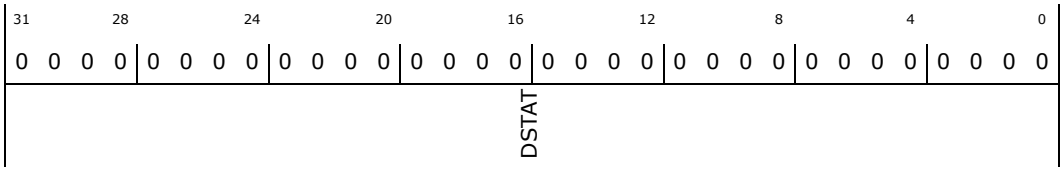
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1E0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.73 reg_SSTATAR_type (SSTATAR5)—Offset 1E8h

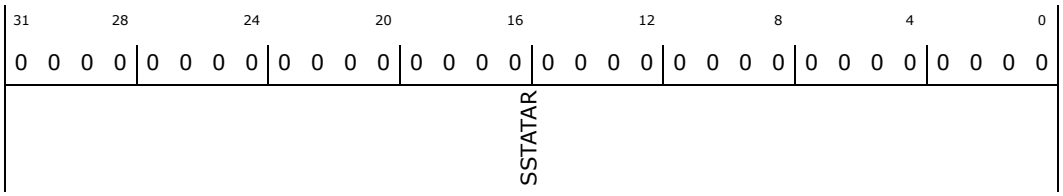
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1E8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.74 reg_DSTATAR_type (DSTATAR5)—Offset 1F0h

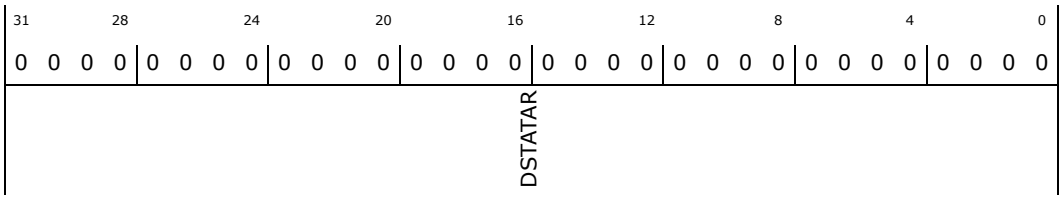
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1F0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.75 reg_CFG_LO_type (CFG_LO5)—Offset 1F8h

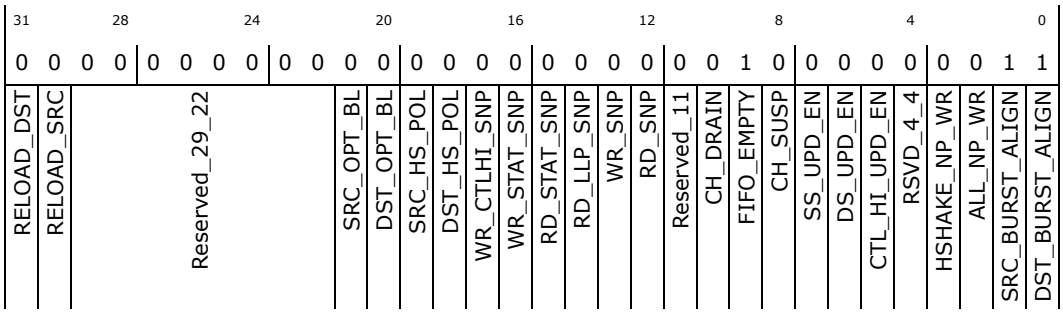
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 1F8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.76 reg_CFG_HI_type (CFG_HI5)—Offset 1FCh

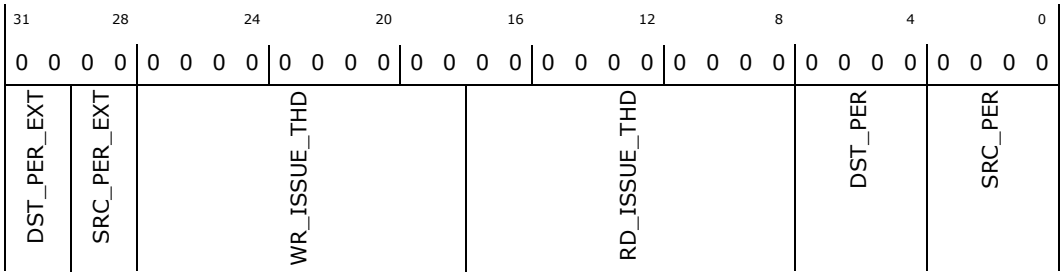
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 1FCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.77 reg_SGR_type (SGR5)—Offset 200h

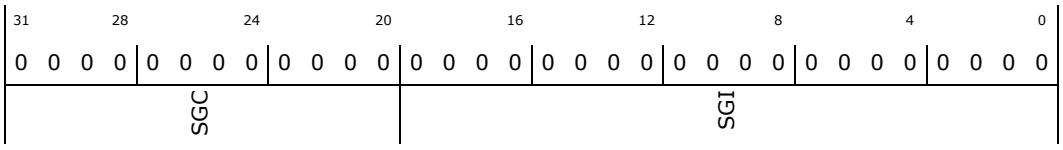
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 200h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.78 reg_DSR_type (DSR5)—Offset 208h

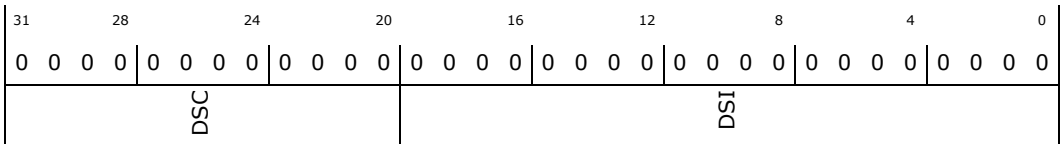
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 208h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.79 reg_SAR_type (SAR6)—Offset 210h

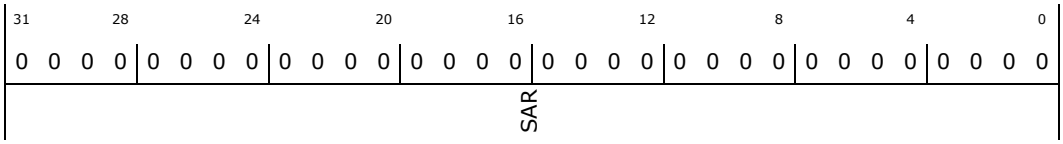
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 210h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.80 reg_DAR_type (DAR6)—Offset 218h

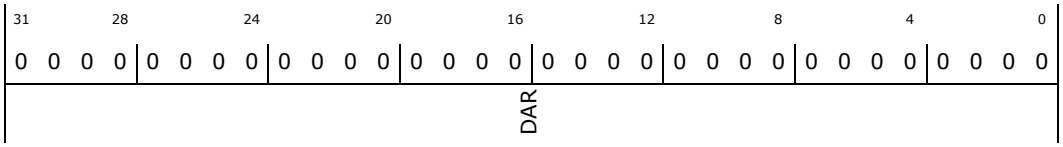
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 218h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.81 reg_LLP_type (LLP6)—Offset 220h

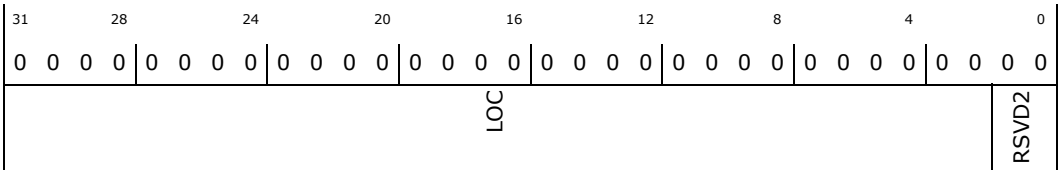
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 220h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.82 reg_CTL_LO_type (CTL_LO6)—Offset 228h

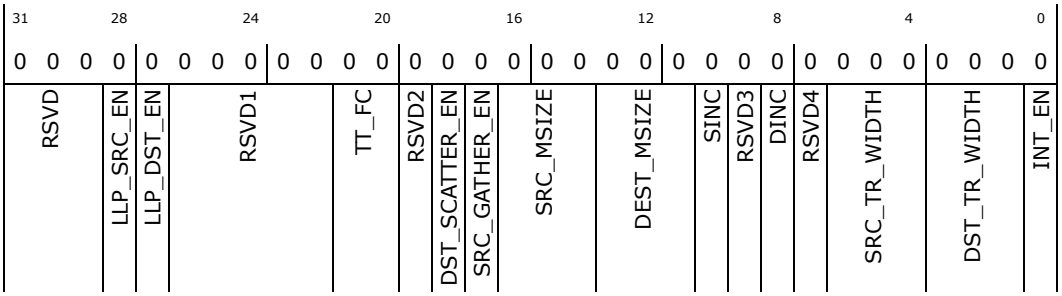
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 228h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.83 reg_CTL_HI_type (CTL_HI6)—Offset 22Ch

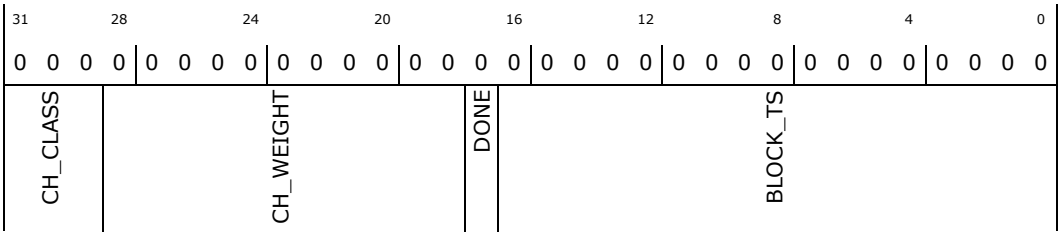
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 22Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.84 reg_SSTAT_type (SSTAT6)—Offset 230h

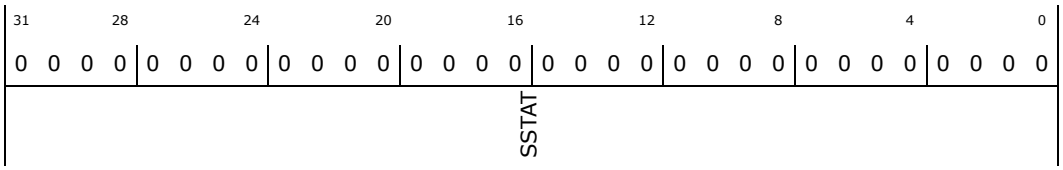
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 230h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.85 reg_DSTAT_type (DSTAT6)—Offset 238h

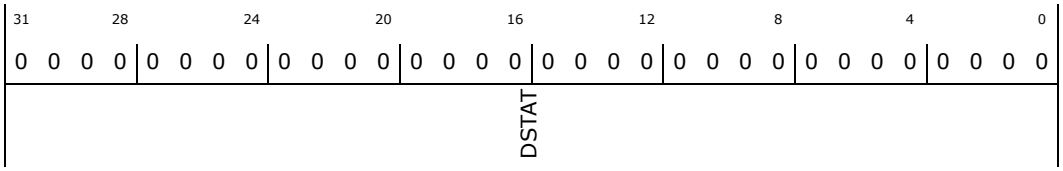
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 238h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.86 reg_SSTATAR_type (SSTATAR6)—Offset 240h

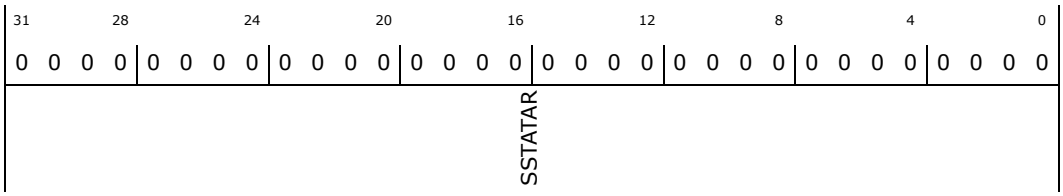
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 240h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.87 reg_DSTATAR_type (DSTATAR6)—Offset 248h

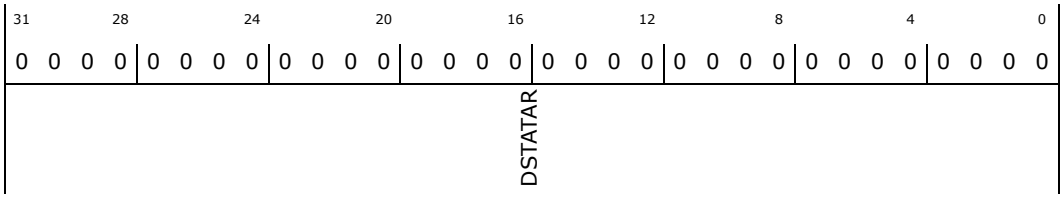
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 248h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.88 reg_CFG_LO_type (CFG_LO6)—Offset 250h

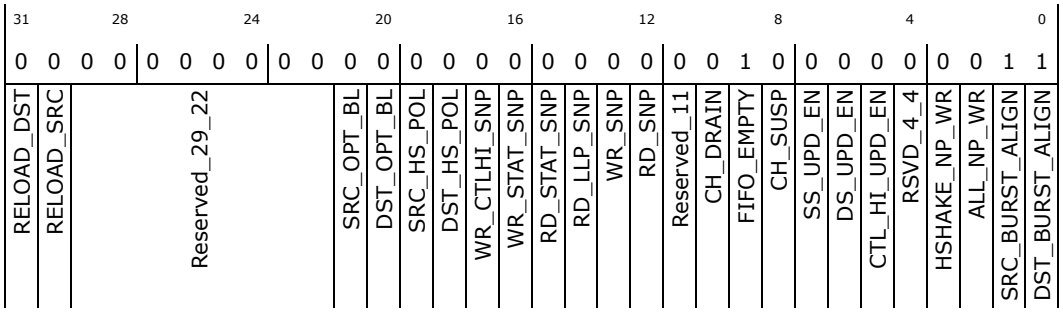
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 250h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.89 reg_CFG_HI_type (CFG_HI6)—Offset 254h

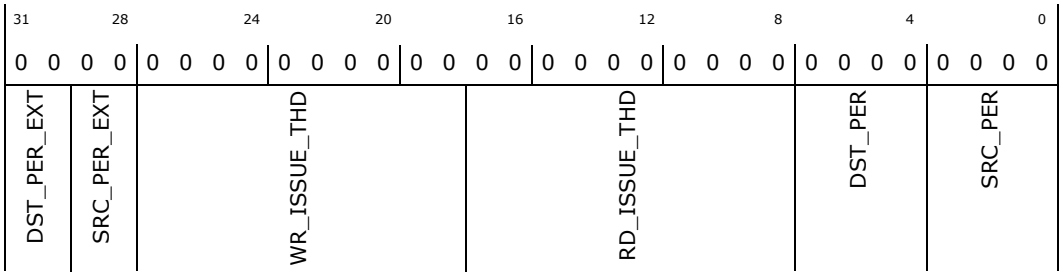
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 254h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.90 reg_SGR_type (SGR6)—Offset 258h

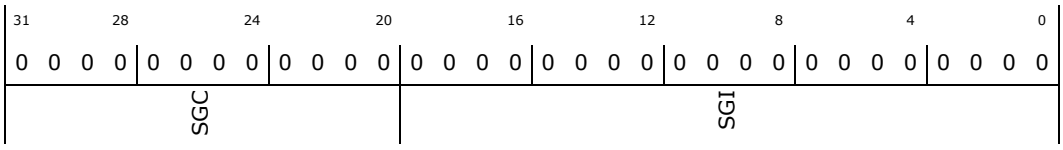
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 258h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.91 reg_DSR_type (DSR6)—Offset 260h

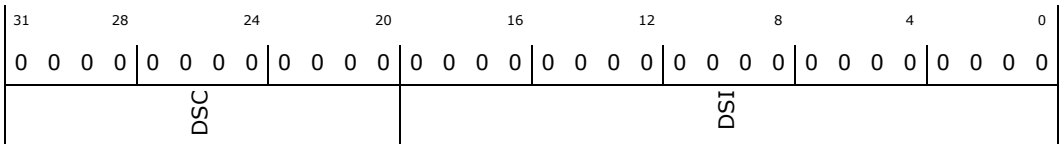
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 260h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.92 reg_SAR_type (SAR7)—Offset 268h

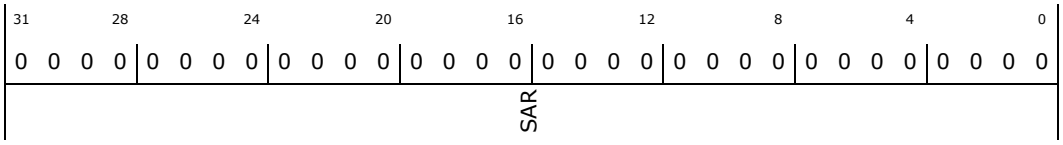
The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 268h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.93 reg_DAR_type (DAR7)—Offset 270h

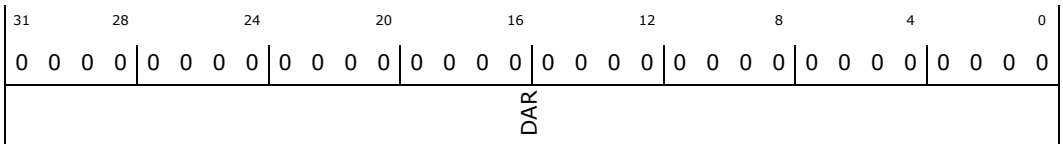
The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 270h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

8.3.94 reg_LLP_type (LLP7)—Offset 278h

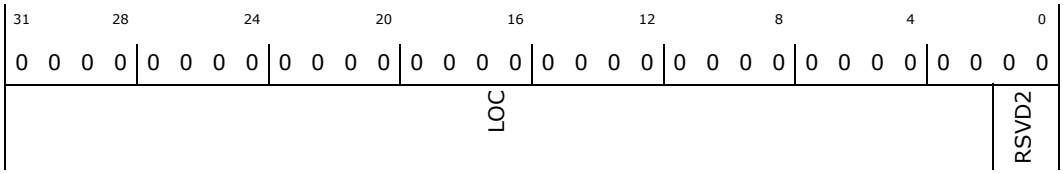
Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 278h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0x0 RO	**RSVD2:** Reserved

8.3.95 reg_CTL_LO_type (CTL_LO7)—Offset 280h

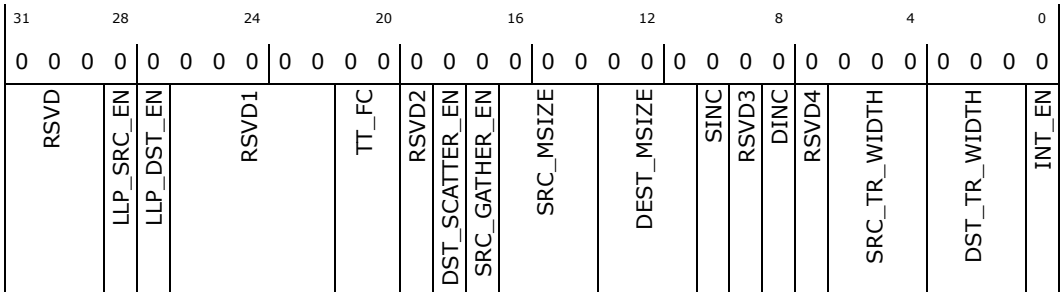
This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 280h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD:** Reserved
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0x0 RO	**RSVD1:** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21:20	0x0 RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0x0 RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0x0 RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0x0 RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0x0 RO	**RSVD3:** Reserved
8	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0x0 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

8.3.96 reg_CTL_HI_type (CTL_HI7)—Offset 284h

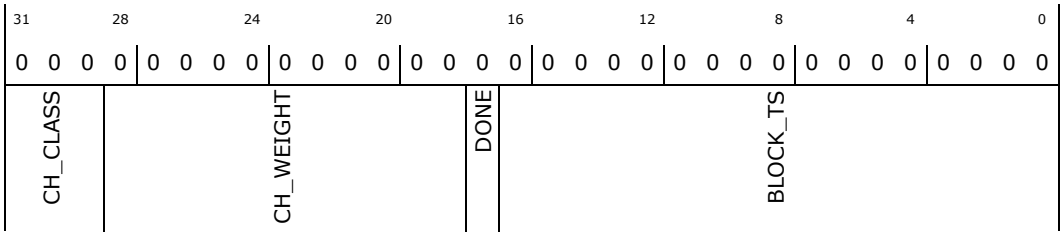
This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

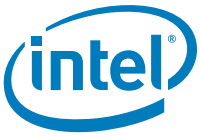
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 284h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below



Bit Range	Default & Access	Field Name (ID): Description
28:18	0x0 RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0x0 RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0x0 RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

8.3.97 reg_SSTAT_type (SSTAT7)—Offset 288h

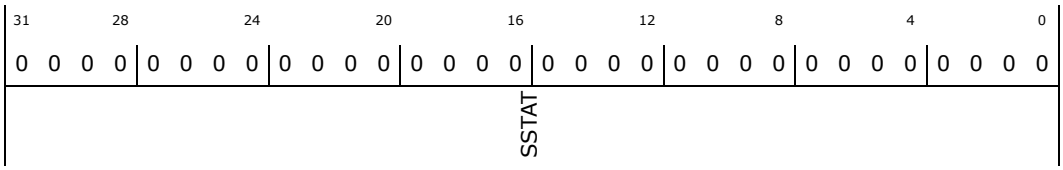
After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 288h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

8.3.98 reg_DSTAT_type (DSTAT7)—Offset 290h

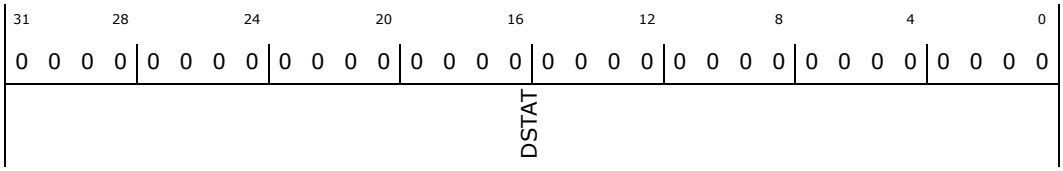
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 290h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

8.3.99 reg_SSTATAR_type (SSTATAR7)—Offset 298h

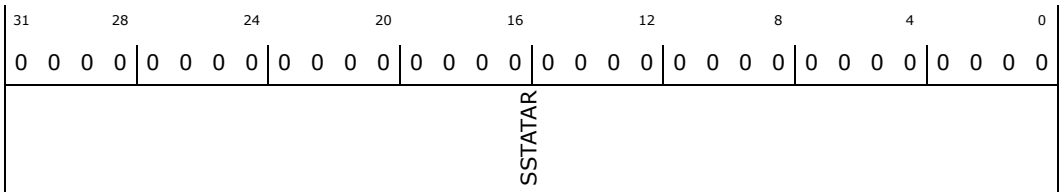
After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 298h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

8.3.100 reg_DSTATAR_type (DSTATAR7)—Offset 2A0h

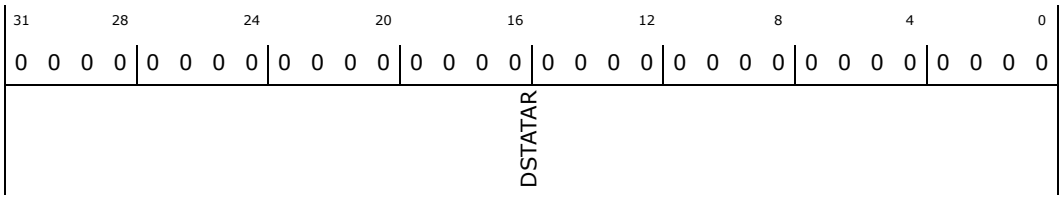
After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 2A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

8.3.101 reg_CFG_LO_type (CFG_LO7)—Offset 2A8h

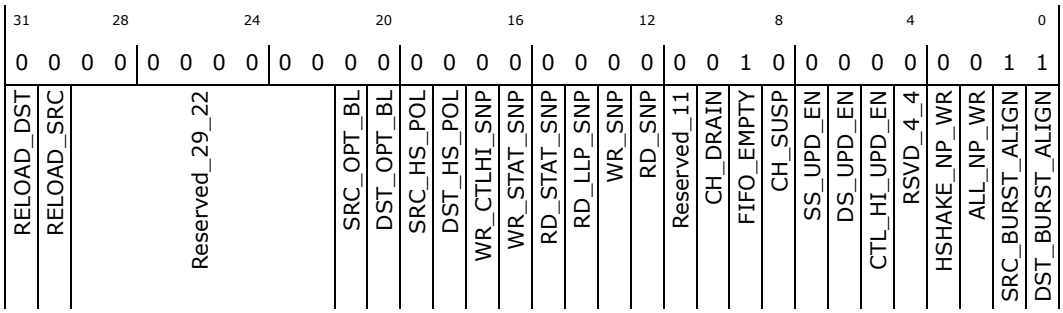
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 2A8h

Default: 00000203h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0x0 RO	**Reserved_29_22:** Reserved
21	0x0 RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0x0 RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values
16	0x0 RW	**WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values
14	0x0 RW	**RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors
13	0x0 RW	**WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port
12	0x0 RW	**RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port
11	0x0 RO	**Reserved_11:** Reserved
10	0x0 RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0x0 RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0x0 RO	**RSVD_4_4:** Reserved
3	0x0 RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0x0 RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	0x1 RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary

Bit Range	Default & Access	Field Name (ID): Description
0	0x1 RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

8.3.102 reg_CFG_HI_type (CFG_HI7)—Offset 2ACh

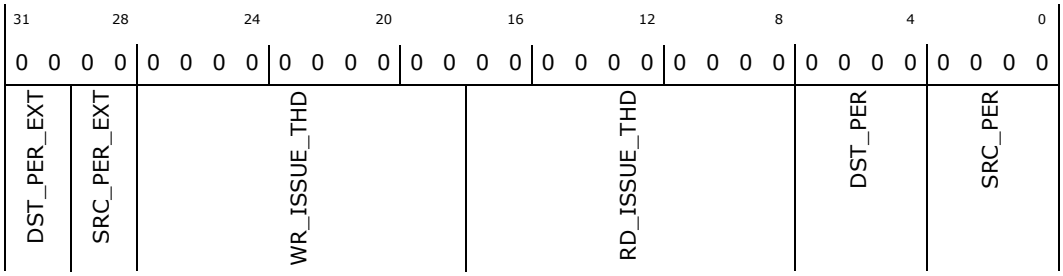
This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 2ACh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0x0 RW	**SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0x0 RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0x0 RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0x0 RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

8.3.103 reg_SGR_type (SGR7)—Offset 2B0h

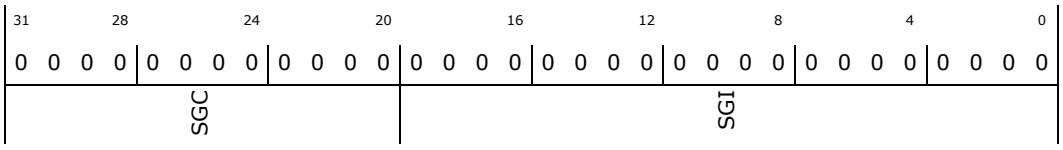
The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 2B0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval.

8.3.104 reg_DSR_type (DSR7)—Offset 2B8h

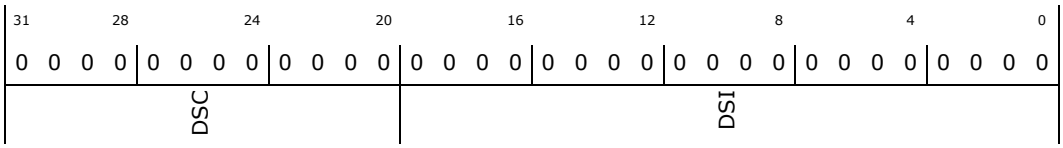
The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 2B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI:** Destination scatter interval.

8.3.105 reg_Raw_type (RawTfr)—Offset 2C0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 2C0h

Default: 00000000h

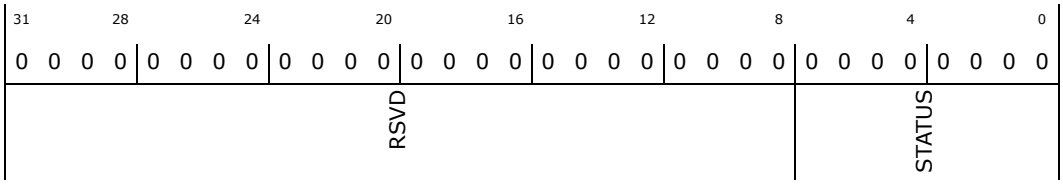
Offset: [Ipe_bridge.BAR + 94000h] + 308h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**STATUS:** Interrupt status

8.3.115 reg_Mask_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation.

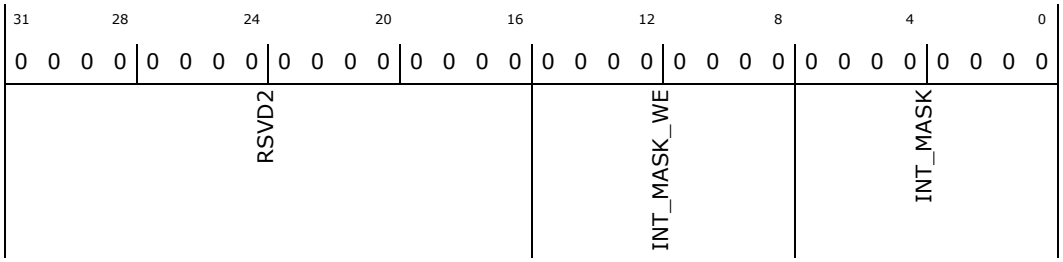
For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 310h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:0	0x0 RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

8.3.116 reg_Mask_type (MaskBlock)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 318h

Default: 00000000h

7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.3.121 reg_Clear_type (ClearBlock)—Offset 340h

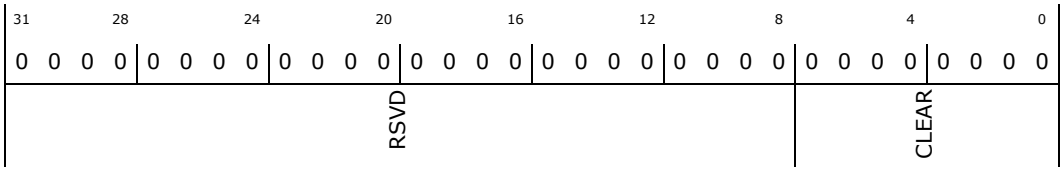
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 340h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.3.122 reg_Clear_type (ClearSrcTran)—Offset 348h

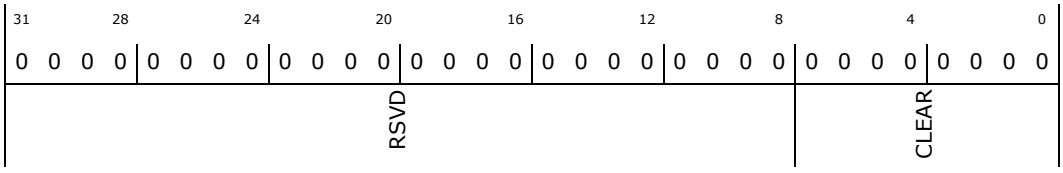
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 348h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.3.123 reg_Clear_type (ClearDstTran)—Offset 350h

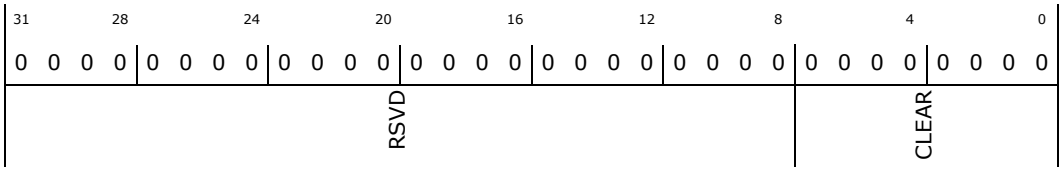
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 350h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.3.124 reg_Clear_type (ClearErr)—Offset 358h

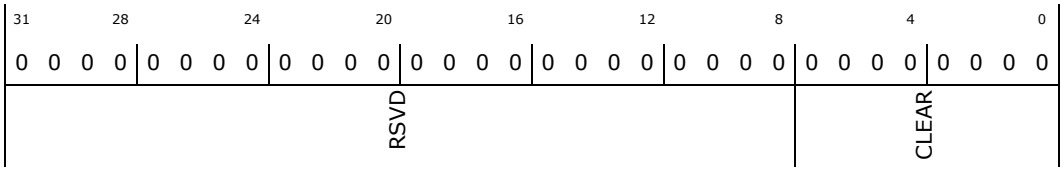
Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 358h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

8.3.125 reg_StatusInt_type (StatusInt)—Offset 360h

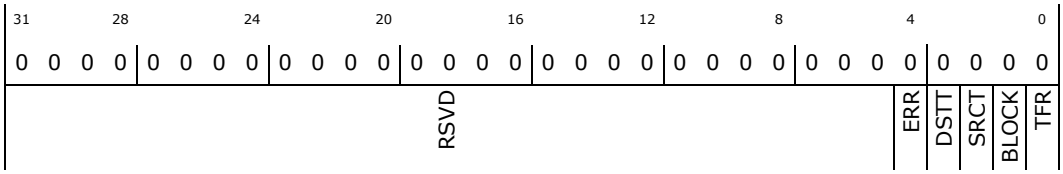
The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran,StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 360h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**RSVD:** Reserved
4	0x0 RO	**ERR:** OR of the contents of StatusErr register.
3	0x0 RO	**DSTT:** OR of the contents of StatusDst register.
2	0x0 RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0x0 RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0x0 RO	**TFR:** OR of the contents of StatusTfr register.

8.3.126 reg_DmaCfgReg_type (DmaCfgReg)—Offset 398h

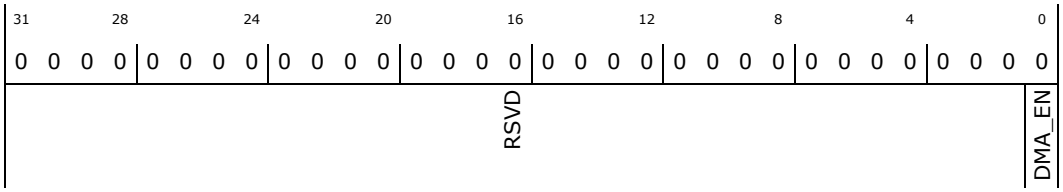
This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 398h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD:** Reserved
0	0x0 RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

8.3.127 reg_ChEnReg_type (ChEnReg)—Offset 3A0h

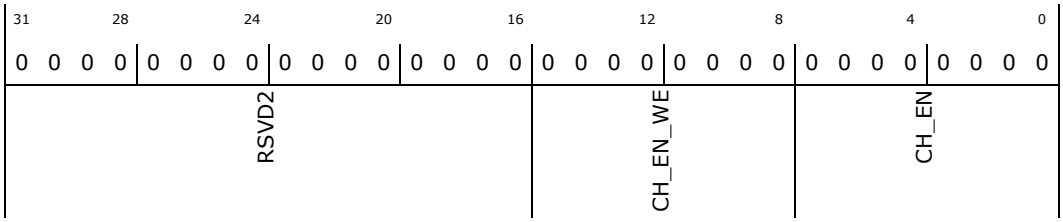
This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 3A0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 WO	**CH_EN_WE:** Channel enable write enable.
7:0	0x0 RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

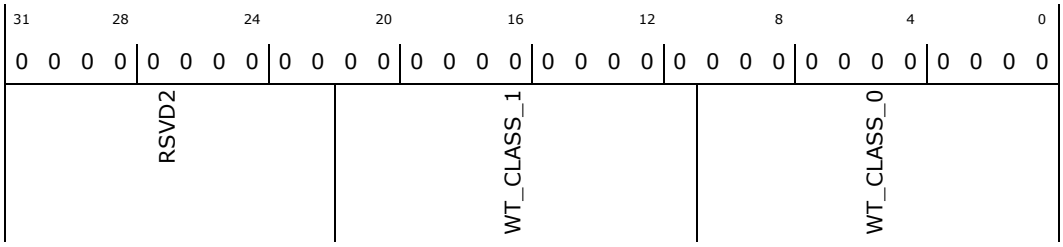
8.3.128 reg_CLASS_PRIORITY0_LO_type (ClassPriority0_LO)—Offset 3B8h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 3B8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD2:** Reserved
21:11	0x0 RW	**WT_CLASS_1:** Class Weight 1: Value of K assigns a weight of (K+1) to Class 1. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_0:** Class Weight 0: Value of K assigns a weight of (K+1) to Class 0. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

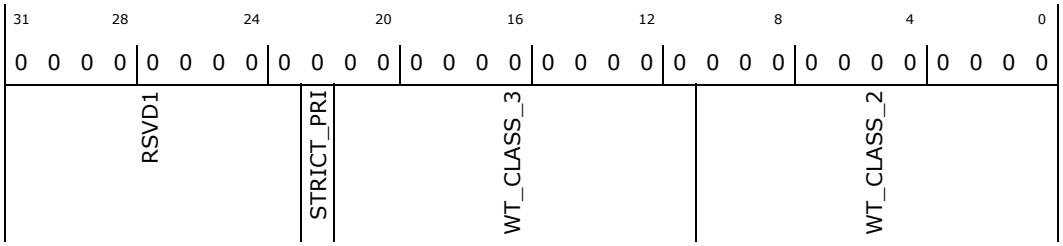
8.3.129 reg_CLASS_PRIORITY0_HI_type (ClassPriority0_HI)—Offset 3BCh

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 3BCh

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD1:** Reserved
22	0x0 RW	**STRICT_PRI:** If set, Higher class values will always have higher priorities than lower class values. If not set, round-robin arbitration will be used between different classes using WT_CLASS_n values.
21:11	0x0 RW	**WT_CLASS_3:** Class Weight 3: Value of K assigns a weight of (K+1) to Class 3. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_2:** Class Weight 2: Value of K assigns a weight of (K+1) to Class 2. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

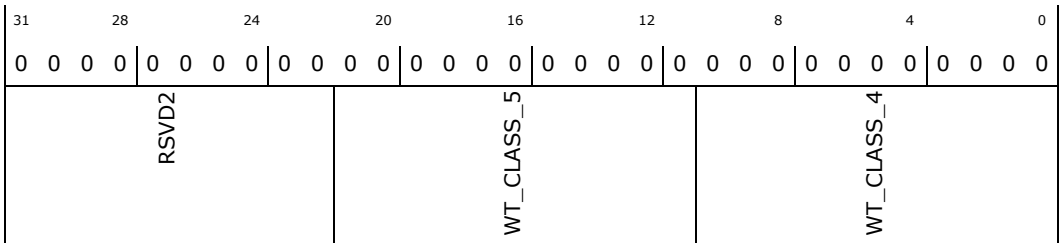
8.3.130 reg_CLASS_PRIORITY1_LO_type (ClassPriority1_LO)—Offset 3C0h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 3C0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD2:** Reserved
21:11	0x0 RW	**WT_CLASS_5:** Class Weight 5: Value of K assigns a weight of (K+1) to Class 5. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_4:** Class Weight 4: Value of K assigns a weight of (K+1) to Class 4. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

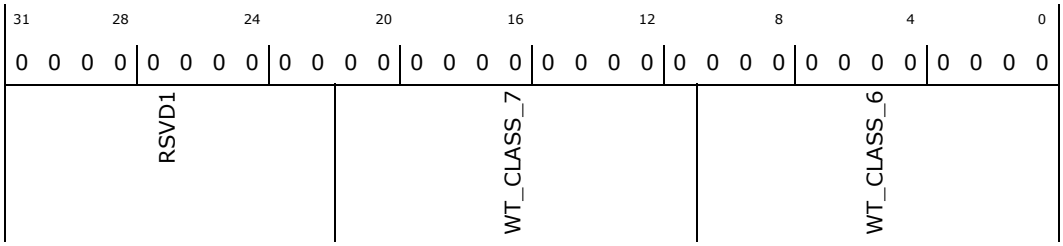
8.3.131 reg_CLASS_PRIORITY1_HI_type (ClassPriority1_HI)—Offset 3C4h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 3C4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**RSVD1:** Reserved
21:11	0x0 RW	**WT_CLASS_7:** Class Weight 7: Value of K assigns a weight of (K+1) to Class 7. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.
10:0	0x0 RW	**WT_CLASS_6:** Class Weight 6: Value of K assigns a weight of (K+1) to Class 6. Since K is from 0 to (2^11-1)=2047, Arbitration Class Weight ranges from 1 to 2048 bytes.

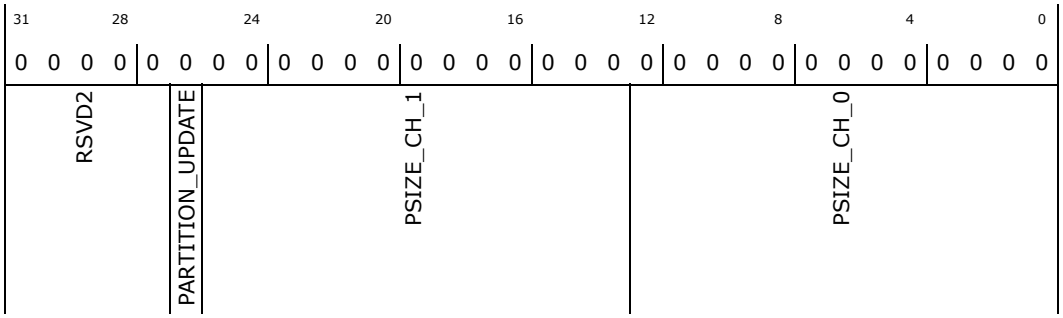
8.3.132 reg_FIFO_PARTITION0_LO_type (FifoPartition0_LO)—Offset 400h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 400h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD2:** Reserved
26	0x0 RW	**PARTITION_UPDATE:** SW needs to write to this bit for the partitioning assignments to take effect.
25:13	0x0 RW	**PSIZE_CH_1:** Partition Byte Size assigned to Channel 1. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_0:** Partition Byte Size assigned to Channel 0. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

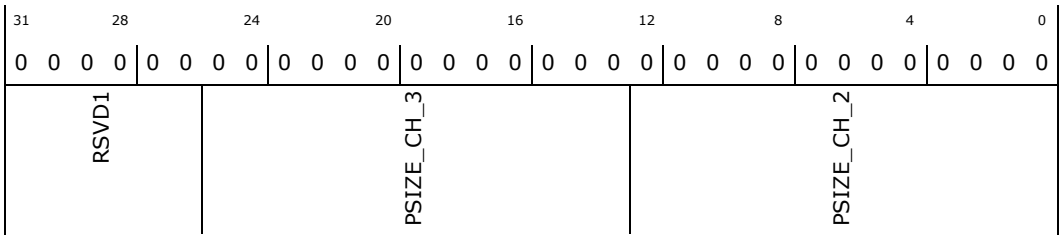
8.3.133 reg_FIFO_PARTITION0_HI_type (FifoPartition0_HI)—Offset 404h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + 94000h] + 404h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_3:** Partition Byte Size assigned to Channel 3. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

Bit Range	Default & Access	Field Name (ID): Description
12:0	0x0 RW	**PSIZE_CH_2:** Partition Byte Size assigned to Channel 2. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

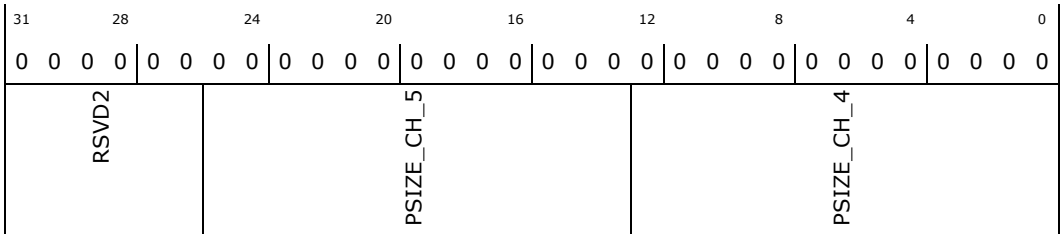
8.3.134 reg_FIFO_PARTITION1_LO_type (FifoPartition1_LO)—Offset 408h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 408h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD2:** Reserved
25:13	0x0 RW	**PSIZE_CH_5:** Partition Byte Size assigned to Channel 5. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_4:** Partition Byte Size assigned to Channel 4. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

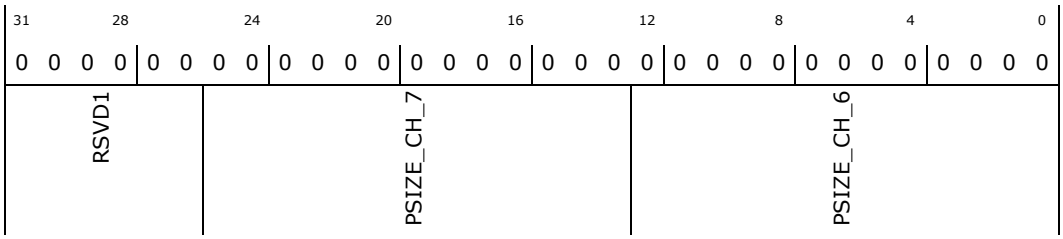
8.3.135 reg_FIFO_PARTITION1_HI_type (FifoPartition1_HI)—Offset 40Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 40Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25:13	0x0 RW	**PSIZE_CH_7:** Partition Byte Size assigned to Channel 7. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.
12:0	0x0 RW	**PSIZE_CH_6:** Partition Byte Size assigned to Channel 6. Ranges from 0 Bytes to (2^13 - 1)=8191 Bytes. However, size needs to be DW Aligned, i.e. a multiple of 4.

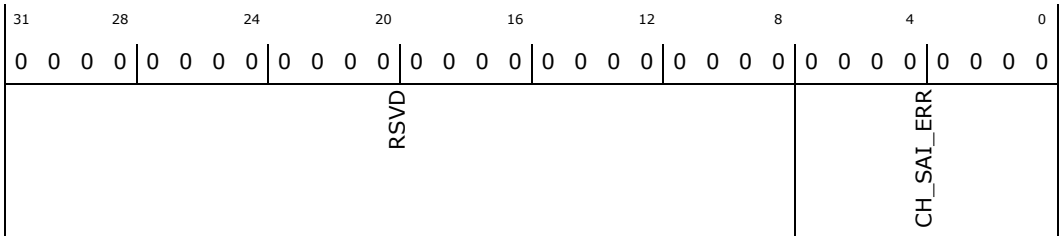
8.3.136 reg_SAI_Error_type (SAI_ERR)—Offset 410h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 410h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RO	**CH_SAI_ERR:** 1: SAI Error occurred on Ch [n] 0: No SAI Error occurred on Ch [n] SAI_ERROR[n] is set by HW on SAI violation for channel [n]. All bits get cleared by SW when reading this register

8.3.137 reg_GLOBAL_CFG_type (GLOBAL_CFG)—Offset 418h

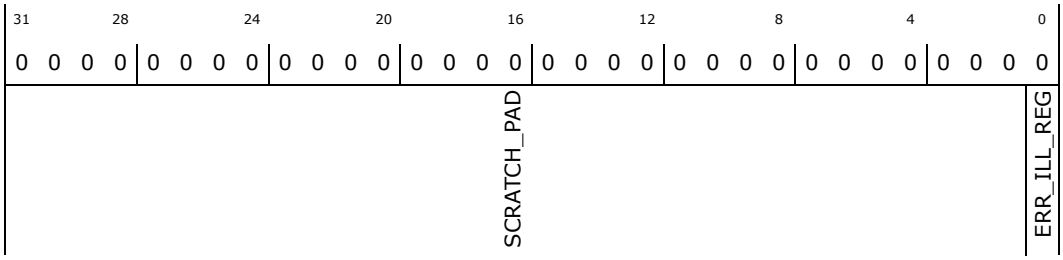
GLOBAL_CFG: GLOBAL DMA Configuration Register

Access Method

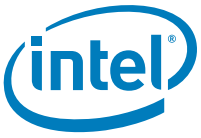
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + 94000h] + 418h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future configuration and de-feature bits.
0	0x0 RW	**ERR_ILL_REG:** 0x1 : Issue ERR response on reading illegal (non-existing) registers 0x0 : Issue DVA response on reading illegal (non-existing) registers



8.4 LPE PCI Configuration Registers

Table 55. Summary of LPE PCI Configuration Registers—0/21/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 3711	0F288086h

F8–FBh	4	"reg_MANID_type (MANID)—Offset F8h" on page 3718	04000F1Ch

8.4.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

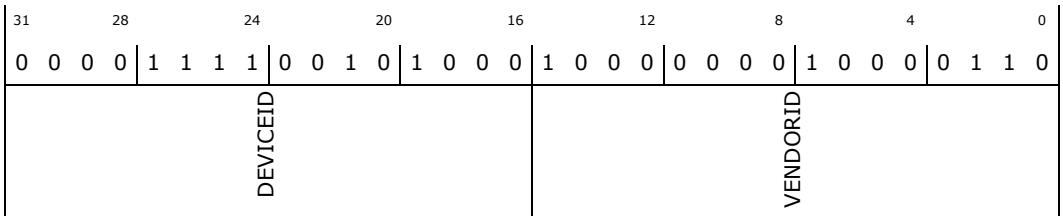
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 0h

Default: 0F288086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xf28 RO	**DEVICEID:** Reserved.
15:0	0x8086 RO	**VENDORID:** Reserved.

8.4.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

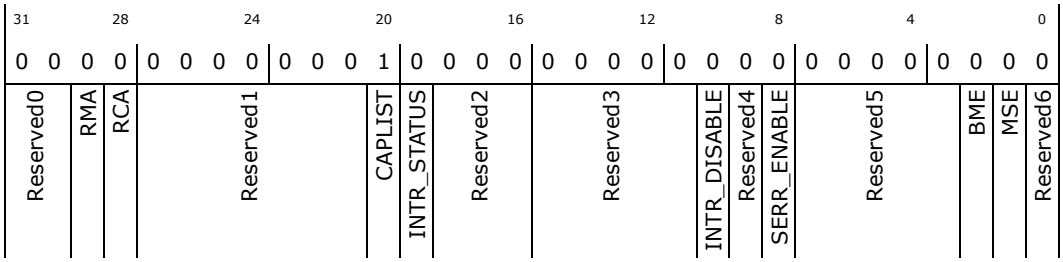
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved0:** Reserved.
29	0x0 RW/1C	**RMA:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW/1C	**RCA:** Reserved.

1	0x0 RW	**MSE:** Reserved.
0	0x0 RO	**Reserved6:** Reserved.

8.4.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

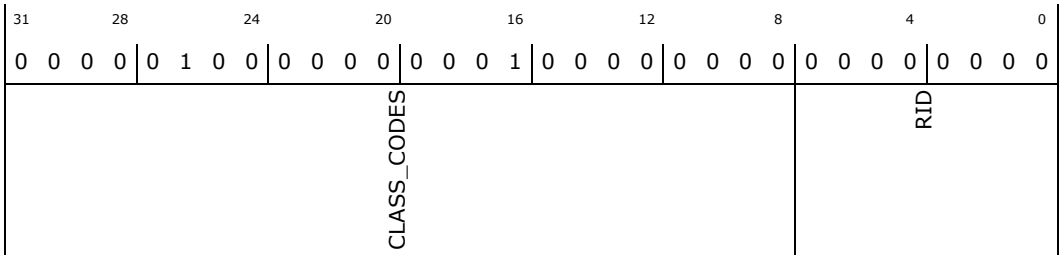
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 8h

Default: 04010000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x40100 RO	**CLASS_CODES:** Reserved.
7:0	0x0 RO	**RID:** Reserved.

8.4.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

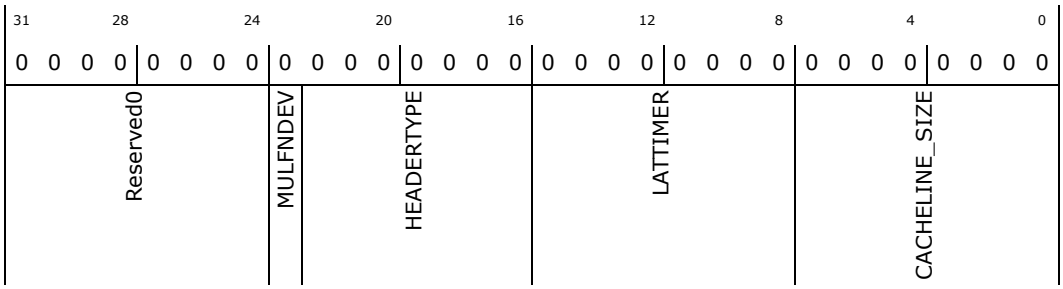
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** Reserved.
23	0x0 RO	**MULFNDEV:** Reserved.
22:16	0x0 RO	**HEADERTYPE:** Reserved.
15:8	0x0 RO	**LATTIMER:** Reserved.
7:0	0x0 RW	**CACHELINE_SIZE:** Reserved.

8.4.5 reg_BAR_type (BAR)—Offset 10h

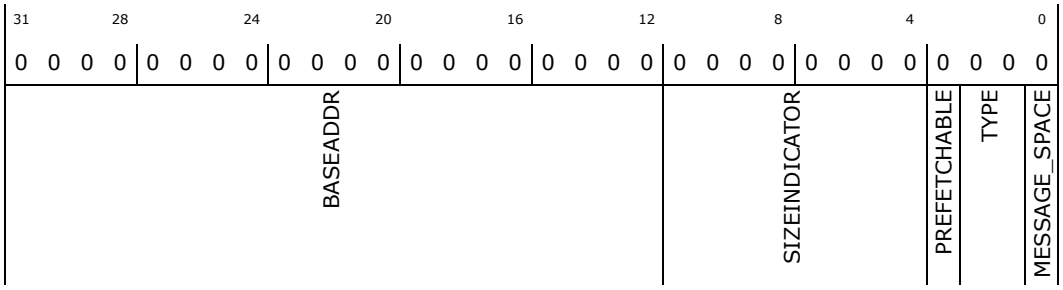
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR:** Reserved.
3	0x0 RO	**PREFETCHABLE:** Reserved.
2:1	0x0 RO	**TYPE:** Reserved.
0	0x0 RO	**MESSAGE_SPACE:** Reserved.

8.4.6 reg_BAR1_type (BAR1)—Offset 18h

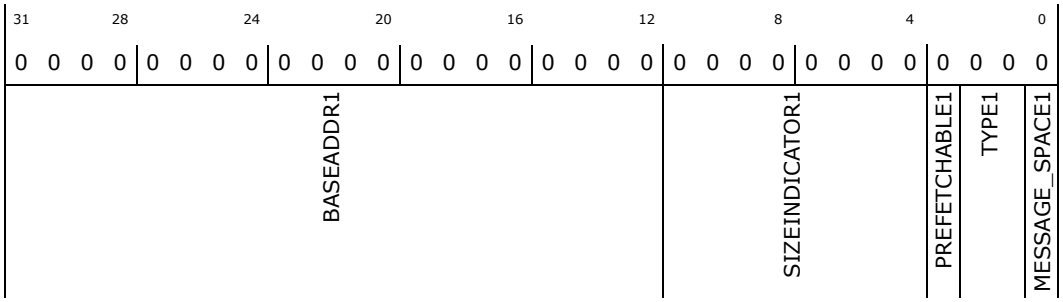
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR1:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO	**PREFETCHABLE1:** Reserved.
2:1	0x0 RO	**TYPE1:** Reserved.
0	0x0 RO	**MESSAGE_SPACE1:** Reserved.

8.4.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

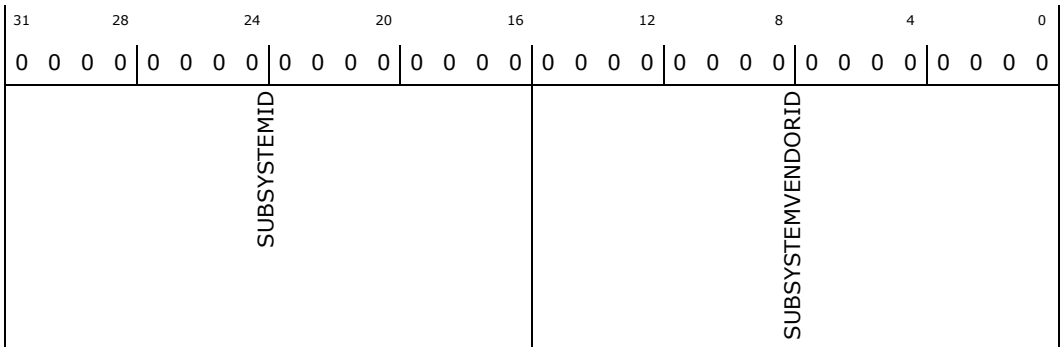
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**SUBSYSTEMID:** Reserved.
15:0	0x0 RW/O	**SUBSYSTEMVENDORID:** Reserved.

8.4.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

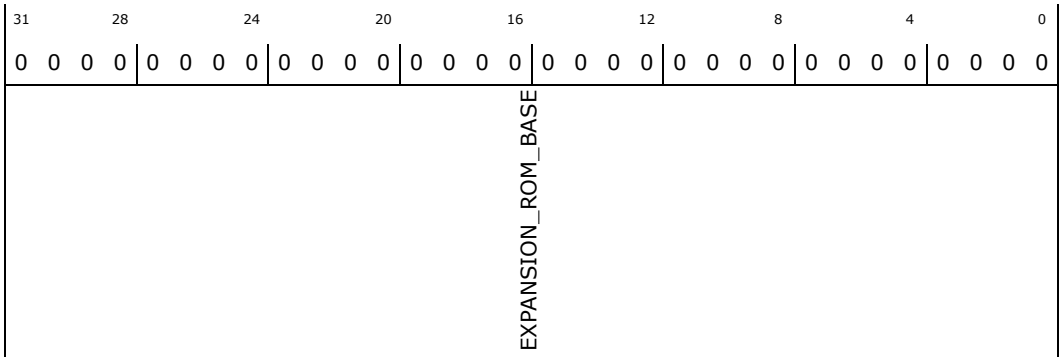
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**EXPANSION_ROM_BASE:** Reserved.

8.4.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

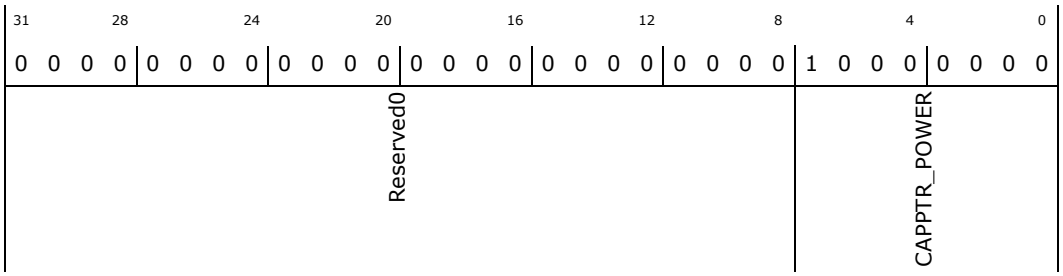
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x80 RO	**CAPPTR_POWER:** Reserved.

8.4.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

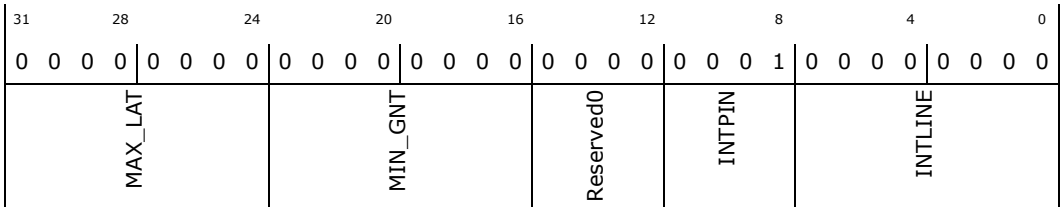
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**MAX_LAT:** Reserved.
23:16	0x0 RO	**MIN_GNT:** Reserved.
15:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RO	**INTPIN:** Reserved.
7:0	0x0 RW	**INTLINE:** Reserved.

8.4.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

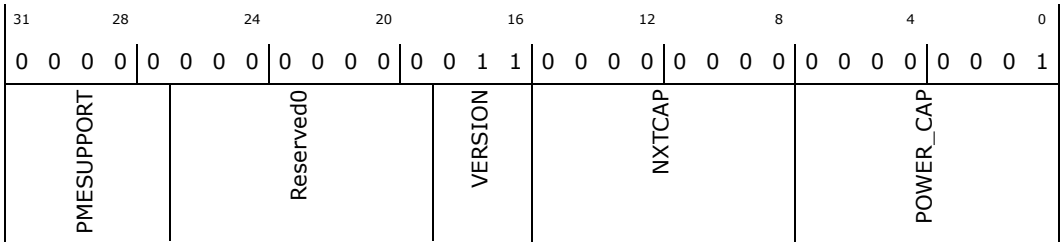
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 80h

Default: 00030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PMESUPPORT:** Reserved.
26:19	0x0 RO	**Reserved0:** Reserved.
18:16	0x3 RO	**VERSION:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**NXTCAP:** Reserved.
7:0	0x1 RO	**POWER_CAP:** Reserved.

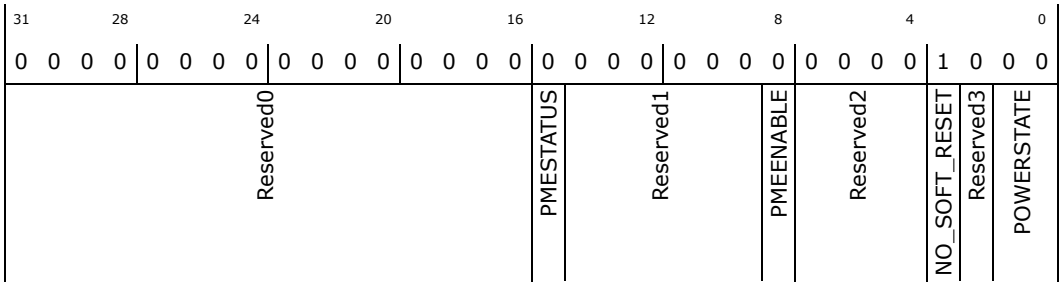
8.4.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved0:** Reserved.
15	0x0 RW/1C	**PMESTATUS:** Reserved.
14:9	0x0 RO	**Reserved1:** Reserved.
8	0x0 RW	**PMEENABLE:** Reserved.
7:4	0x0 RO	**Reserved2:** Reserved.
3	0x1 RO	**NO_SOFT_RESET:** Reserved.
2	0x0 RO	**Reserved3:** Reserved.
1:0	0x0 RW	**POWERSTATE:** Reserved.

8.4.13 reg_MANID_type (MANID)—Offset F8h

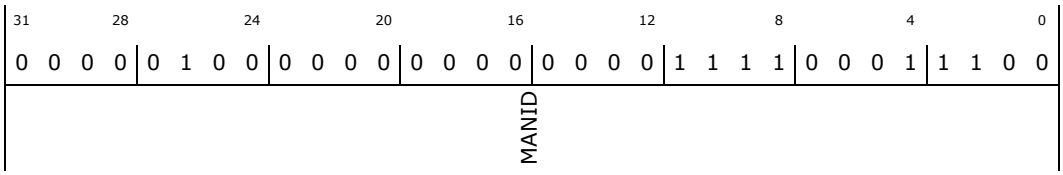
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + F8h

Default: 04000F1Ch



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x4000f1c RO	**MANID:** Reserved.

8.5 LPE Memory Mapped I/O Registers

Table 56. Summary of LPE Memory Mapped I/O Registers—lpe_bridge.BAR1

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 3721	0F288086h

8.5.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

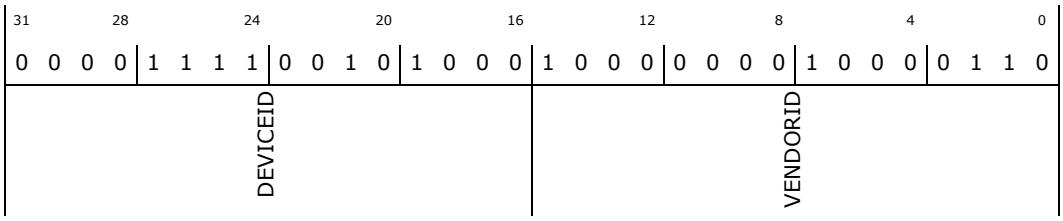
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 0h

Default: 0F288086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xf28 RO	**DEVICEID:** Reserved.
15:0	0x8086 RO	**VENDORID:** Reserved.

8.5.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

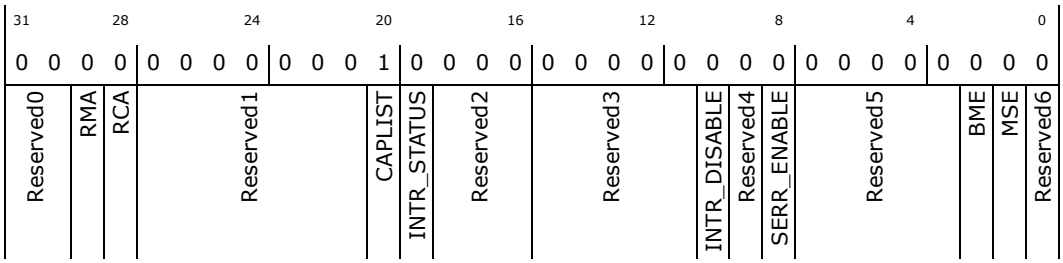
STATUSCOMMAND- Status and Command

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 4h

Default: 00100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved0:** Reserved.
29	0x0 RW/1C	**RMA:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW/1C	**RCA:** Reserved.
27:21	0x0 RO	**Reserved1:** Reserved.
20	0x1 RO	**CAPLIST:** Reserved.
19	0x0 RO	**INTR_STATUS:** Reserved.
18:16	0x0 RO	**Reserved2:** Reserved.
15:11	0x0 RO	**Reserved3:** Reserved.
10	0x0 RW	**INTR_DISABLE:** Reserved.
9	0x0 RO	**Reserved4:** Reserved.
8	0x0 RW	**SERR_ENABLE:** Reserved.
7:3	0x0 RO	**Reserved5:** Reserved.
2	0x0 RW	**BME:** Reserved.
1	0x0 RW	**MSE:** Reserved.
0	0x0 RO	**Reserved6:** Reserved.

8.5.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

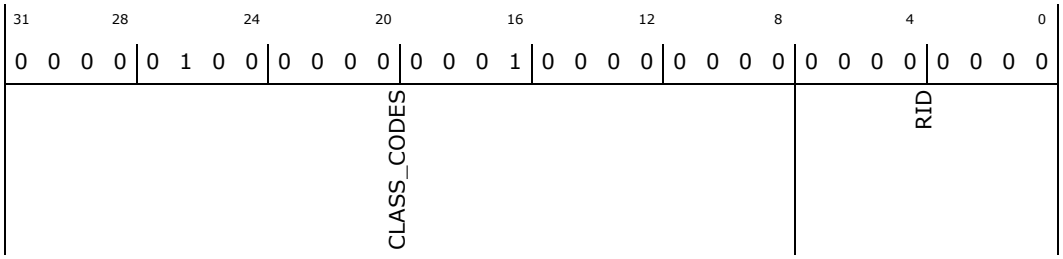
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 8h

Default: 04010000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x40100 RO	**CLASS_CODES:** Reserved.
7:0	0x0 RO	**RID:** Reserved.

8.5.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

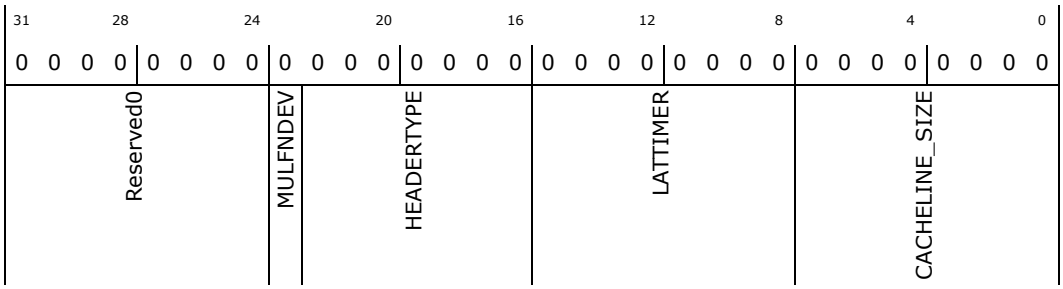
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** Reserved.
23	0x0 RO	**MULFNDEV:** Reserved.
22:16	0x0 RO	**HEADERTYPE:** Reserved.
15:8	0x0 RO	**LATTIMER:** Reserved.
7:0	0x0 RW	**CACHELINE_SIZE:** Reserved.

8.5.5 reg_BAR_type (BAR)—Offset 10h

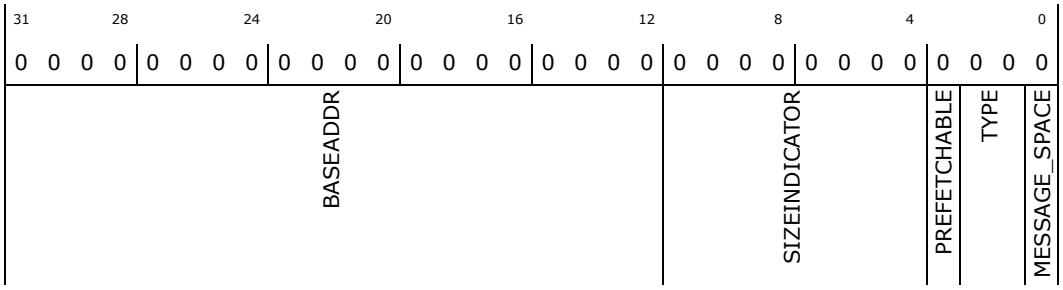
BAR -Base Address Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR:** Reserved.
3	0x0 RO	**PREFETCHABLE:** Reserved.
2:1	0x0 RO	**TYPE:** Reserved.
0	0x0 RO	**MESSAGE_SPACE:** Reserved.

8.5.6 reg_BAR1_type (BAR1)—Offset 18h

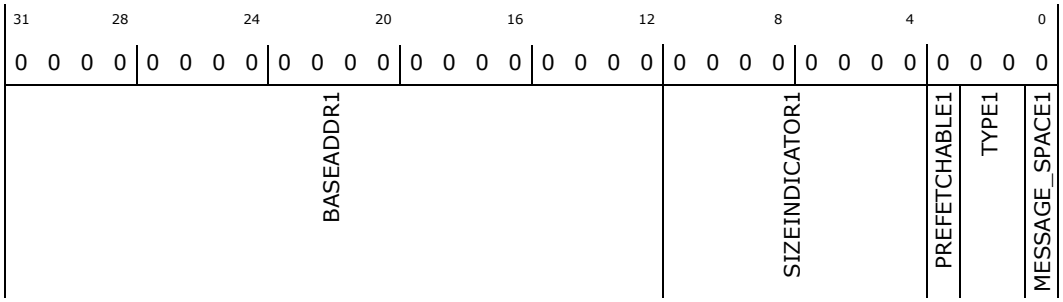
BAR1 -Base Address Register1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR1] + 18h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR1:** Reserved.
11:4	0x0 RO	**SIZEINDICATOR1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO	**PREFETCHABLE1:** Reserved.
2:1	0x0 RO	**TYPE1:** Reserved.
0	0x0 RO	**MESSAGE_SPACE1:** Reserved.

8.5.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

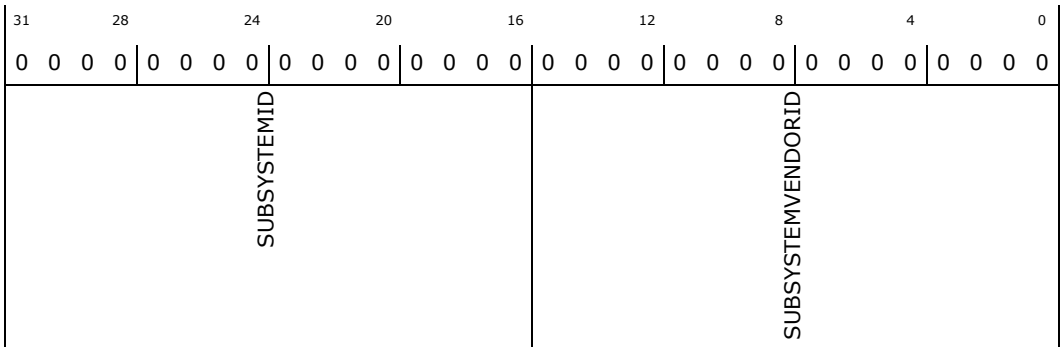
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**SUBSYSTEMID:** Reserved.
15:0	0x0 RW/O	**SUBSYSTEMVENDORID:** Reserved.

8.5.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

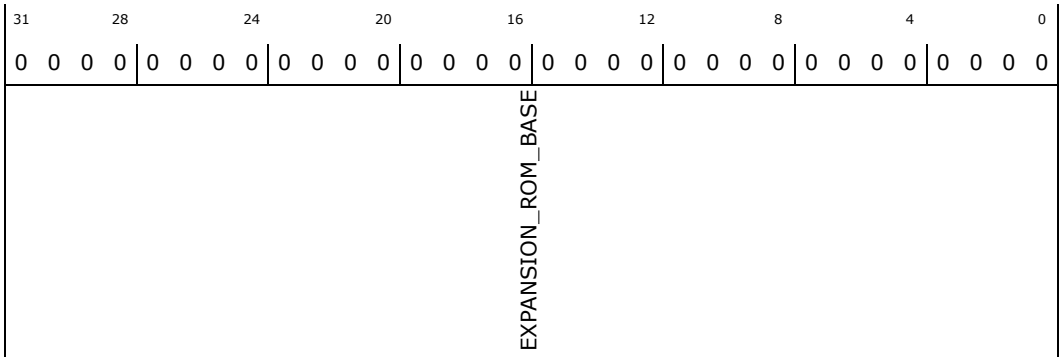
EXPANSION ROM base address

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**EXPANSION_ROM_BASE:** Reserved.

8.5.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

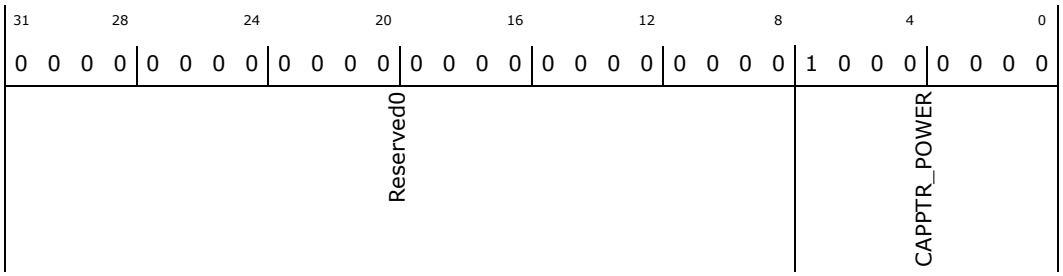
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 34h

Default: 00000080h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved.
7:0	0x80 RO	**CAPPTR_POWER:** Reserved.

8.5.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

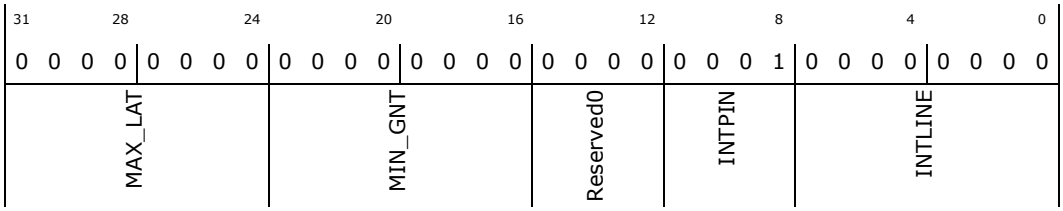
INTERRUPTREG - Interrupt Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**MAX_LAT:** Reserved.
23:16	0x0 RO	**MIN_GNT:** Reserved.
15:12	0x0 RO	**Reserved0:** Reserved.
11:8	0x1 RO	**INTPIN:** Reserved.
7:0	0x0 RW	**INTLINE:** Reserved.

8.5.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

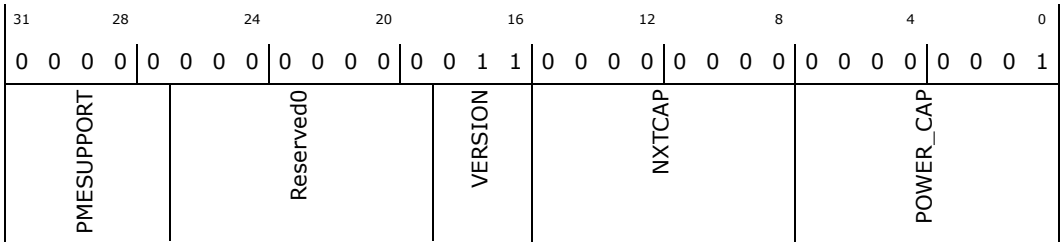
POWERCAPID - PowerManagement Capability ID

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + 80h

Default: 00030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PMESUPPORT:** Reserved.
26:19	0x0 RO	**Reserved0:** Reserved.
18:16	0x3 RO	**VERSION:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**NXTCAP:** Reserved.
7:0	0x1 RO	**POWER_CAP:** Reserved.

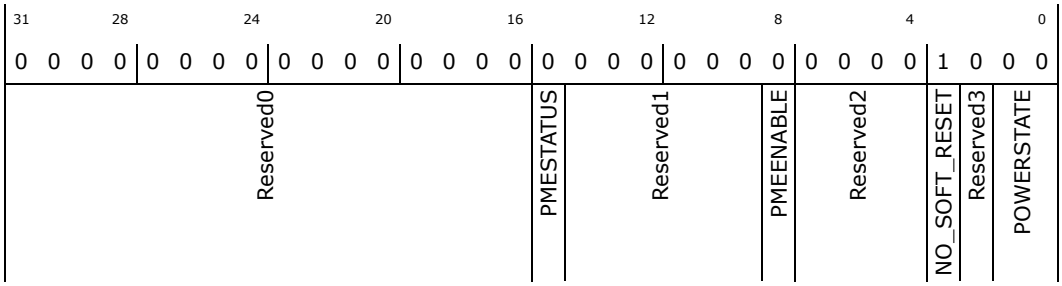
8.5.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR1] + 84h

Default: 00000008h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved0:** Reserved.
15	0x0 RW/1C	**PMESTATUS:** Reserved.
14:9	0x0 RO	**Reserved1:** Reserved.
8	0x0 RW	**PMEENABLE:** Reserved.
7:4	0x0 RO	**Reserved2:** Reserved.
3	0x1 RO	**NO_SOFT_RESET:** Reserved.
2	0x0 RO	**Reserved3:** Reserved.
1:0	0x0 RW	**POWERSTATE:** Reserved.

8.5.13 reg_MANID_type (MANID)—Offset F8h

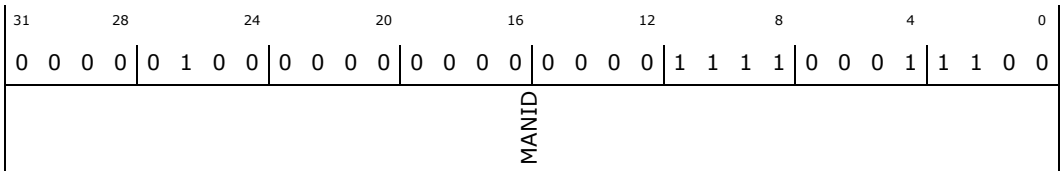
Manufacturers ID

Access Method

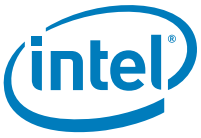
Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR1] + F8h

Default: 04000F1Ch



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x4000f1c RO	**MANID:** Reserved.



8.6 SIO SPI 0 Memory Mapped I/O Registers

Table 57. Summary of SIO SPI 0 Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SSP Control 0 Register (SSCR0)—Offset 0h" on page 3731	00000000h

8.6.1 SSP Control 0 Register (SSCR0)—Offset 0h

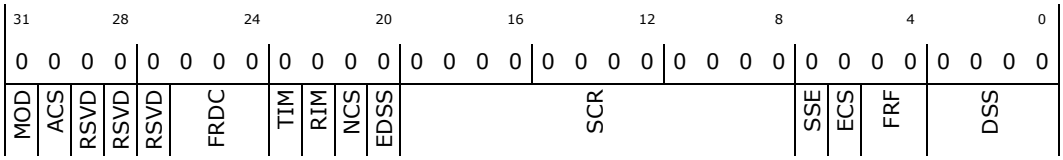
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.6.2 SSP Control 1 Register (SSCR1)—Offset 4h

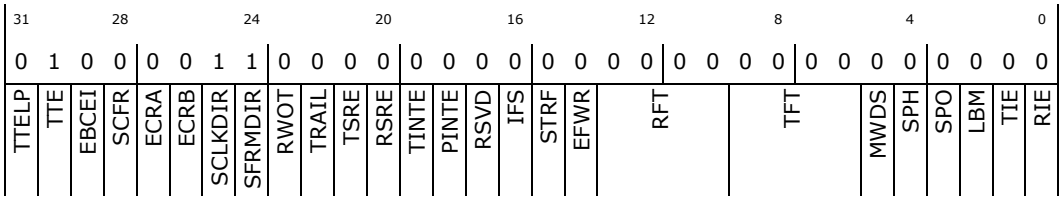
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.6.3 SSP Status Register (SSSR)—Offset 8h

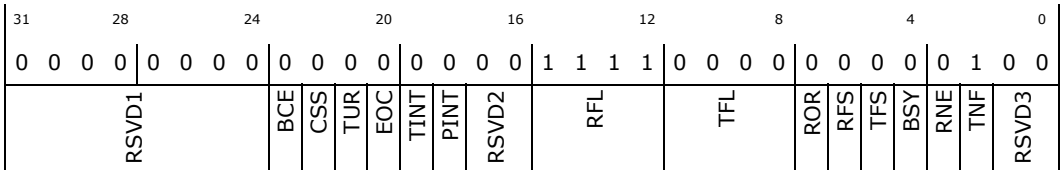
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0x0 RO	**Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0x0 RO	**Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0x0 RO	**Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	0x1 RO	**Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0x0 RO	**RSVD3:** Reserved

8.6.4 SSP Interupt Test Register (SSITR)—Offset Ch

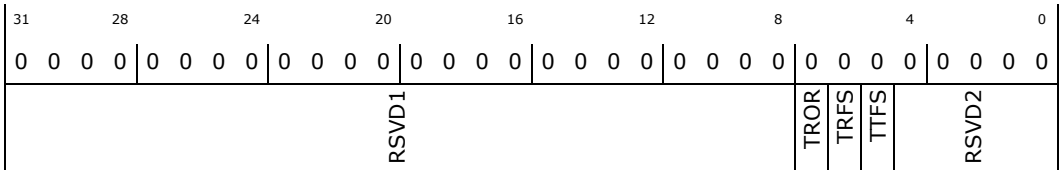
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.6.5 SSP Data Register (SSDR)—Offset 10h

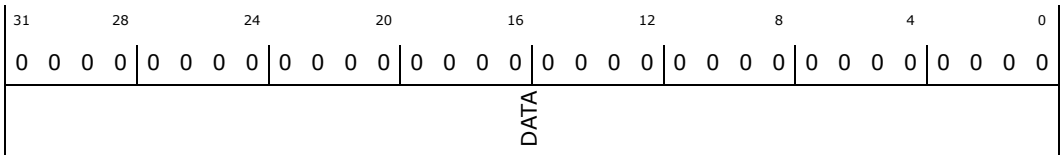
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.6.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

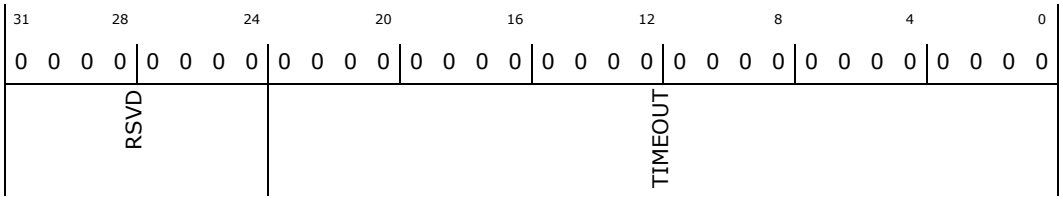
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A0000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.6.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

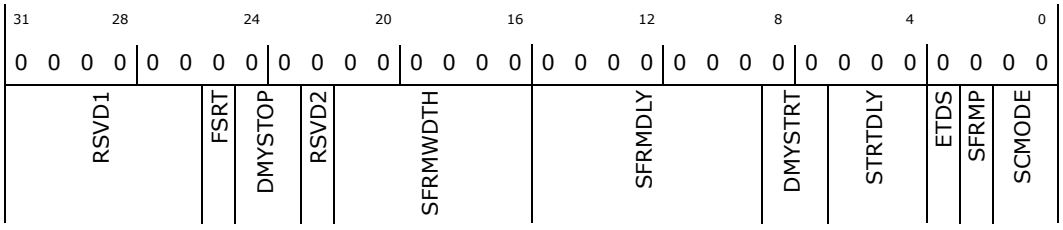
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A0000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.6.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

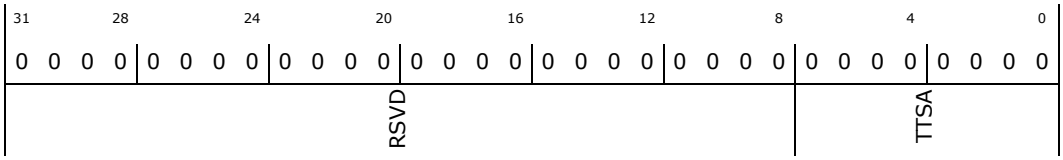
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.6.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

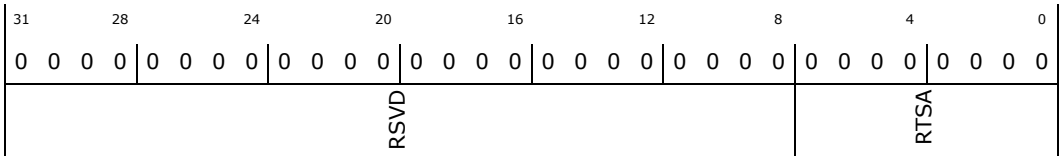
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.6.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

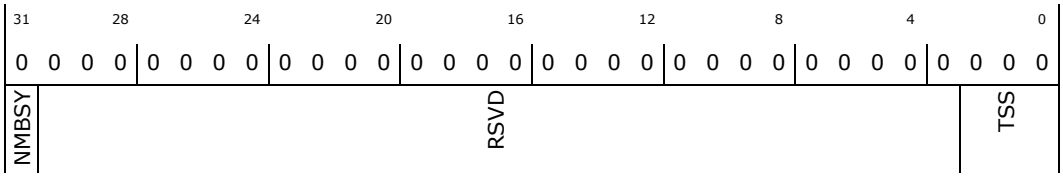
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.6.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

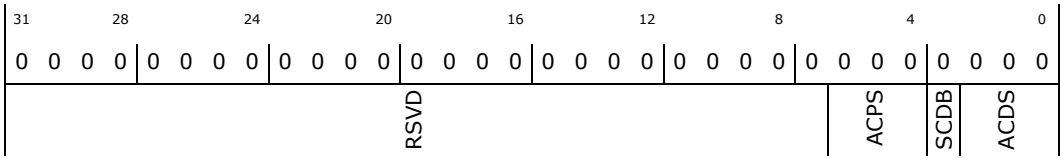
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A0000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.6.12 SSP Control 2 Register (SSCR2)—Offset 40h

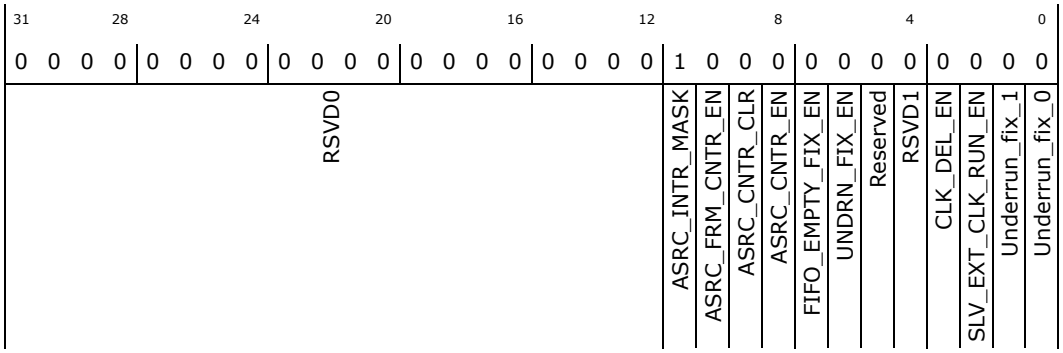
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.6.13 SSP Frame Select Register (SSFS)—Offset 44h

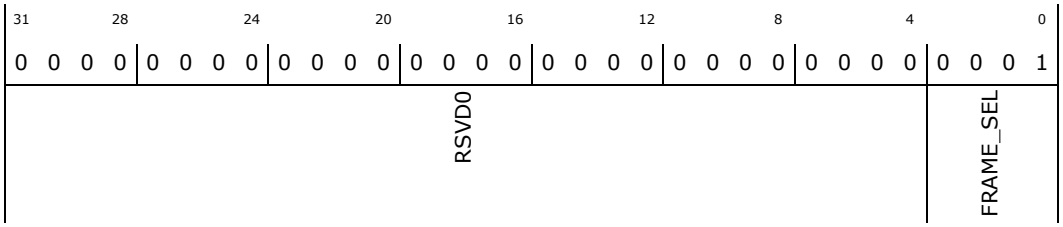
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.6.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

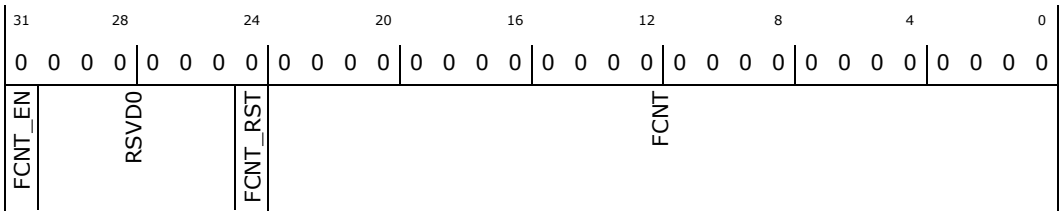
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A0000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.6.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

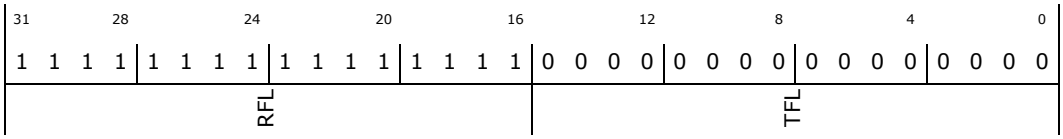
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A0000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.6.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

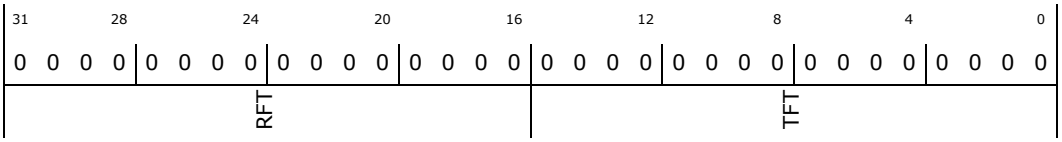
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A0000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.6.17 SSP Control 3 Register (SSCR3)—Offset 70h

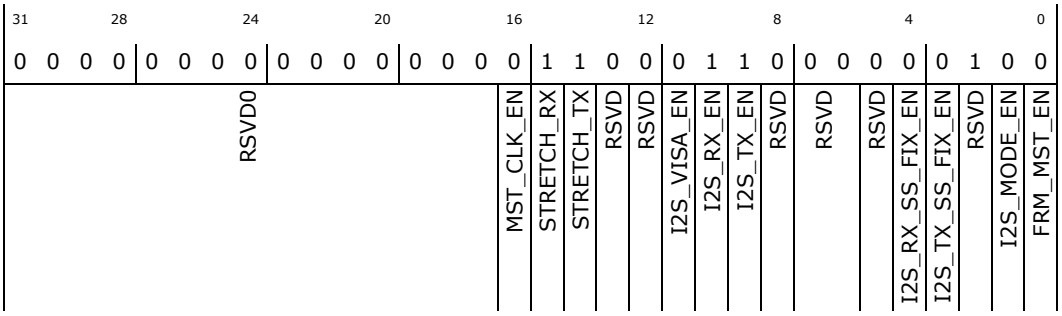
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

8.6.18 SSP Control 4 Register (SSCR4)—Offset 74h

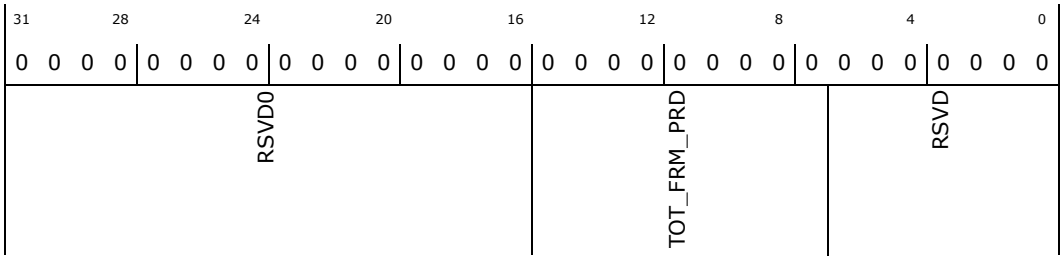
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A0000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.6.19 SSP Control 5 Register (SSCR5)—Offset 78h

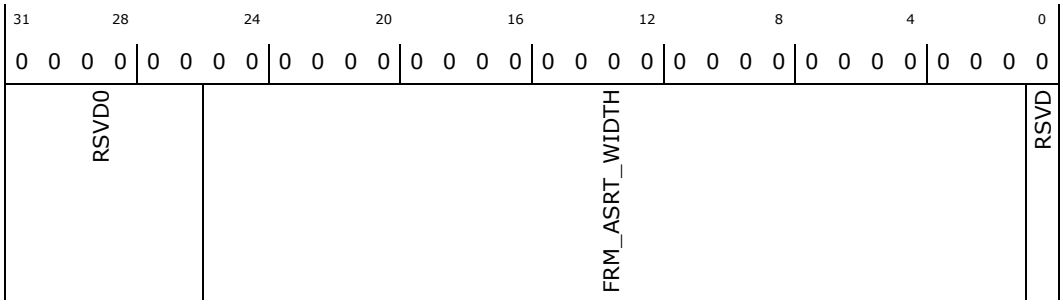
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

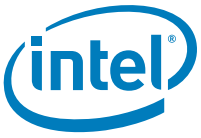
Offset: [Ipe_bridge.BAR + A0000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.



8.7 SIO SPI 1 Memory Mapped I/O Registers

Table 58. Summary of SIO SPI 1 Memory Mapped I/O Registers—lpe_bridge.BAR

8.7.1 SSP Control 0 Register (SSCR0)—Offset 0h

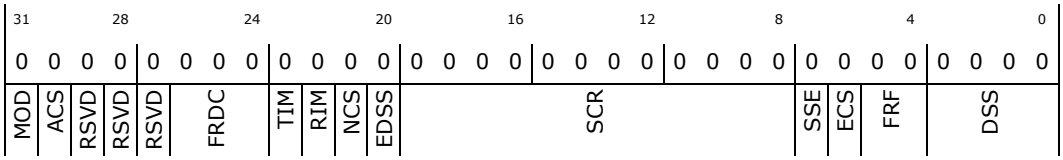
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.7.2 SSP Control 1 Register (SSCR1)—Offset 4h

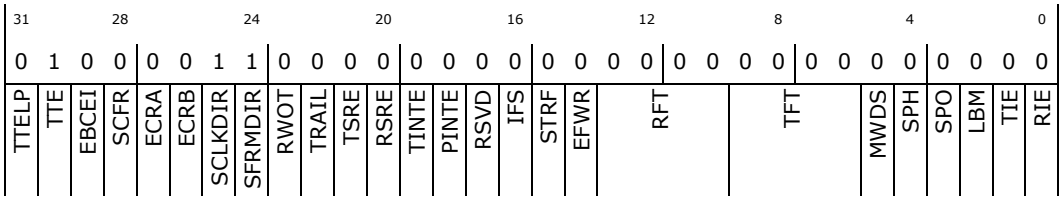
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.7.3 SSP Status Register (SSSR)—Offset 8h

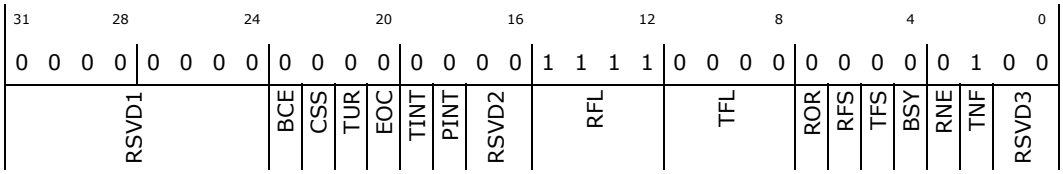
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0x0 RO	**Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0x0 RO	**Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0x0 RO	**Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	0x1 RO	**Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0x0 RO	**RSVD3:** Reserved

8.7.4 SSP Interupt Test Register (SSITR)—Offset Ch

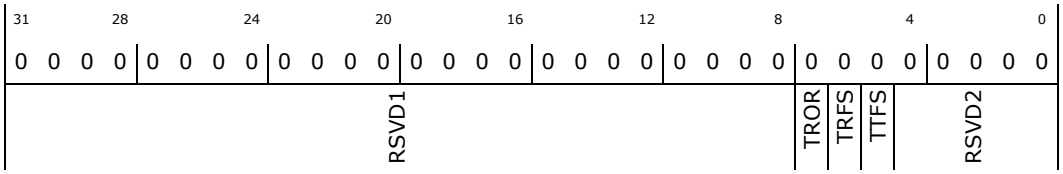
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.7.5 SSP Data Register (SSDR)—Offset 10h

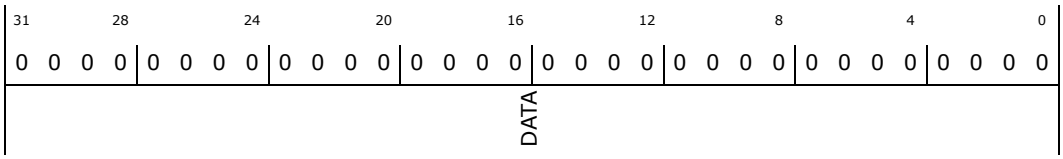
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.7.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

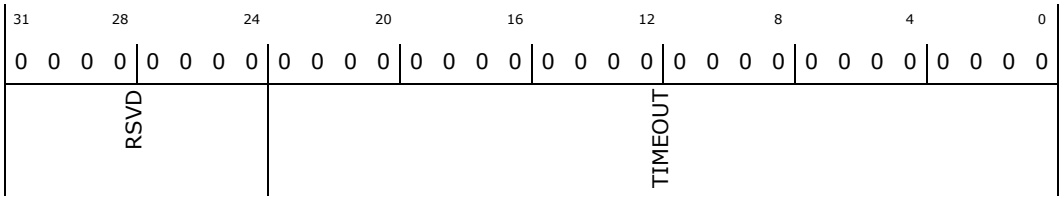
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.7.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

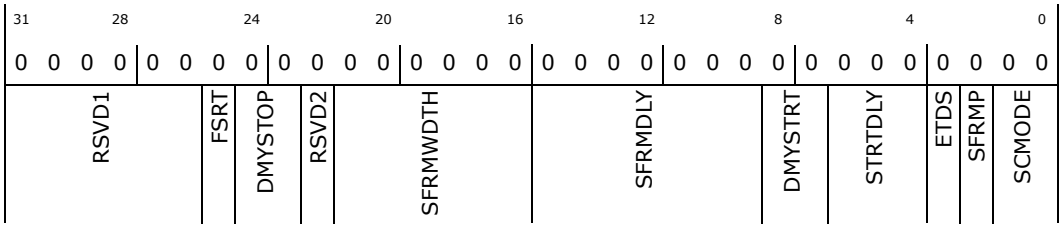
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.7.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

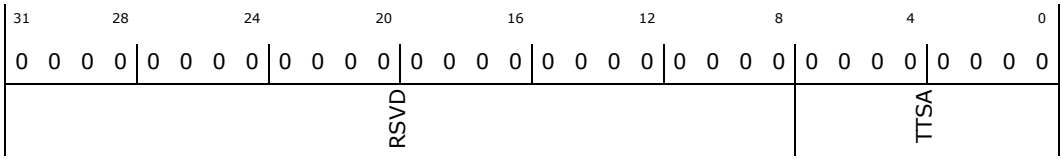
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.7.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

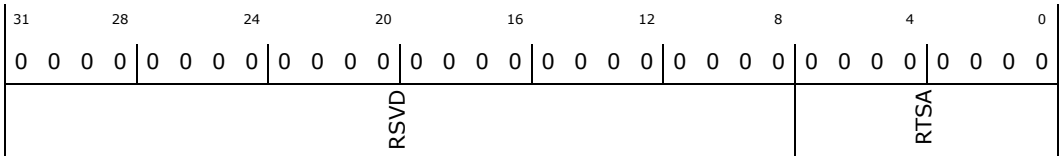
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.7.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

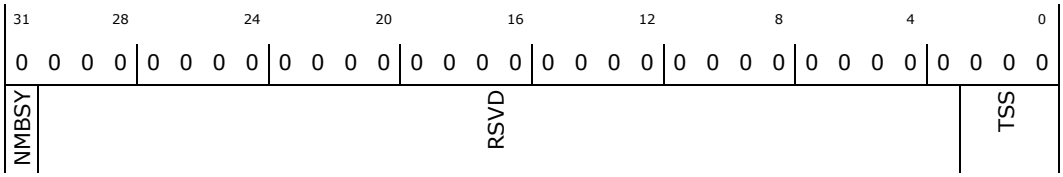
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.7.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

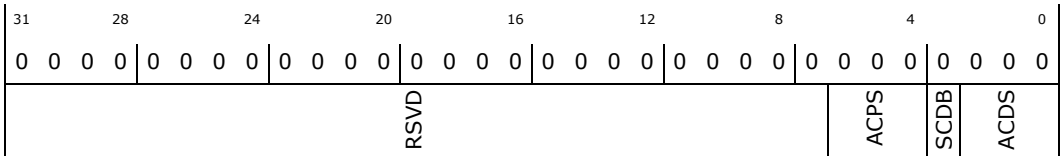
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.7.12 SSP Control 2 Register (SSCR2)—Offset 40h

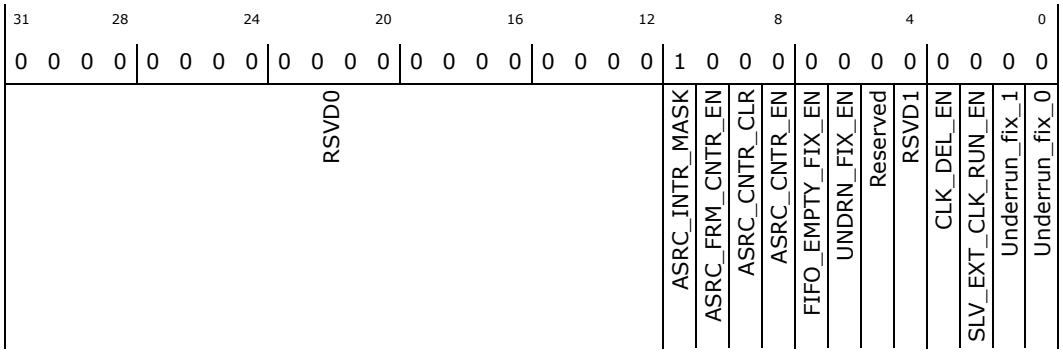
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.7.13 SSP Frame Select Register (SSFS)—Offset 44h

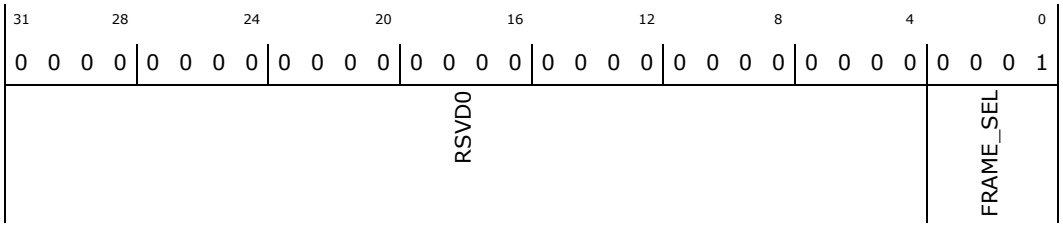
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.7.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

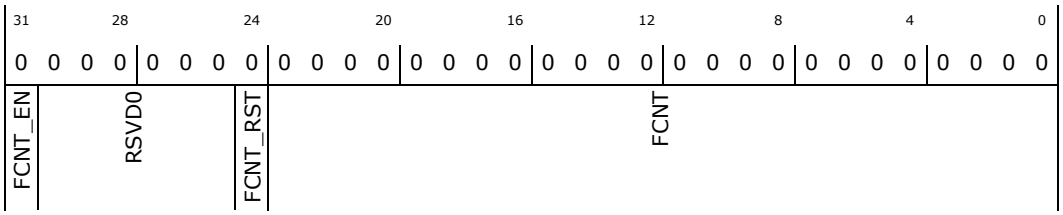
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A1000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.7.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

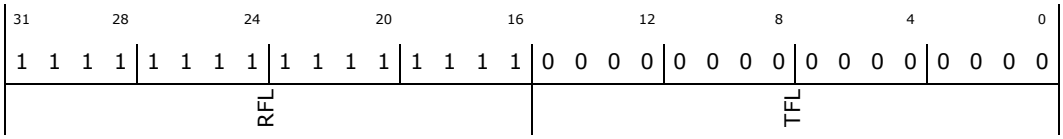
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.7.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

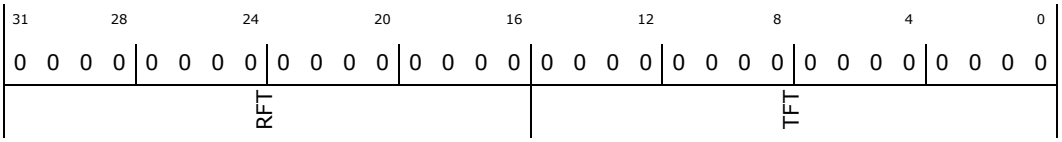
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A1000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.7.17 SSP Control 3 Register (SSCR3)—Offset 70h

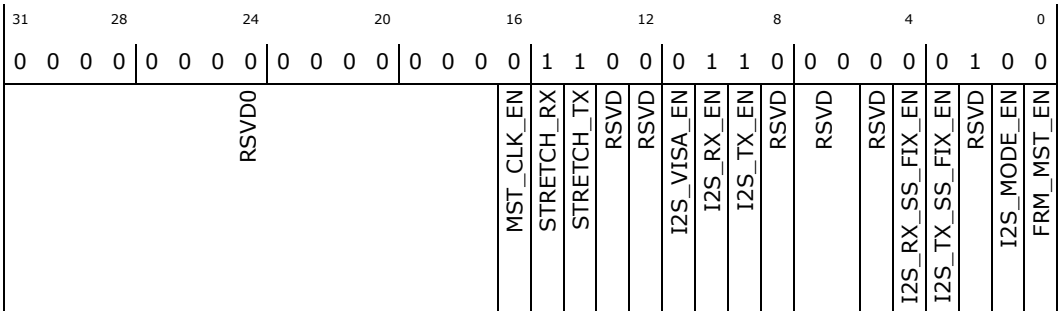
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

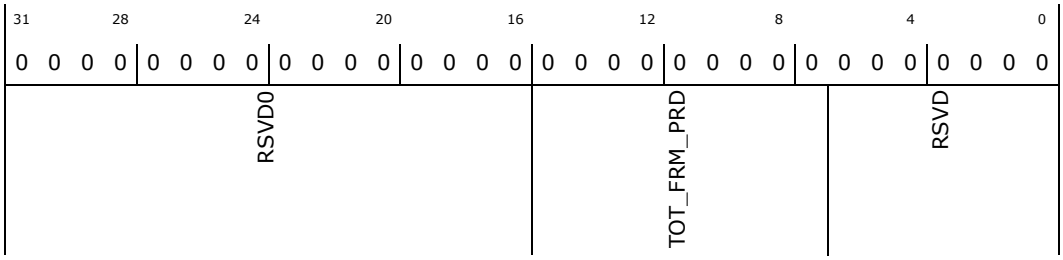
8.7.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **Offset:** [Ipe_bridge.BAR + A1000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.7.19 SSP Control 5 Register (SSCR5)—Offset 78h

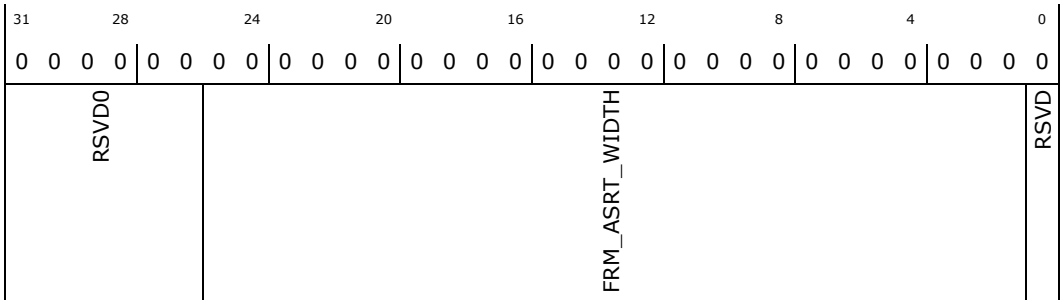
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A1000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.

8.8.1 SSP Control 0 Register (SSCR0)—Offset 0h

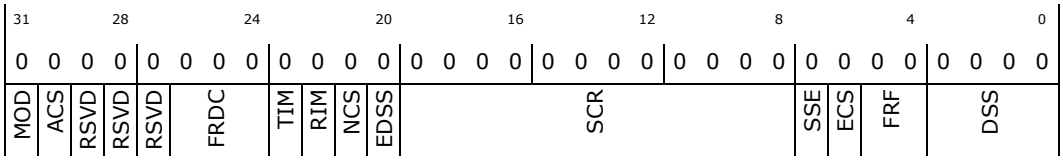
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.8.2 SSP Control 1 Register (SSCR1)—Offset 4h

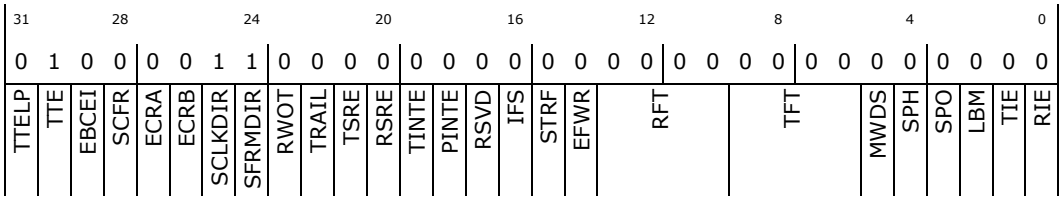
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.8.3 SSP Status Register (SSSR)—Offset 8h

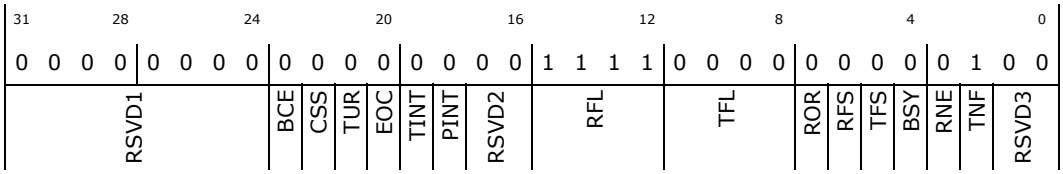
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0x0 RO	**Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0x0 RO	**Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0x0 RO	**Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	0x1 RO	**Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0x0 RO	**RSVD3:** Reserved

8.8.4 SSP Interupt Test Register (SSITR)—Offset Ch

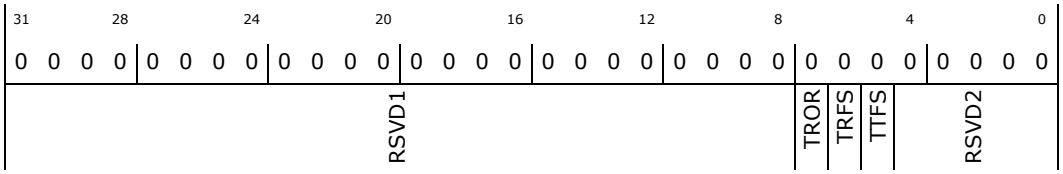
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.8.5 SSP Data Register (SSDR)—Offset 10h

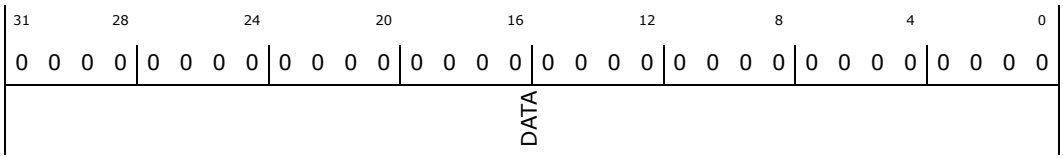
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.8.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

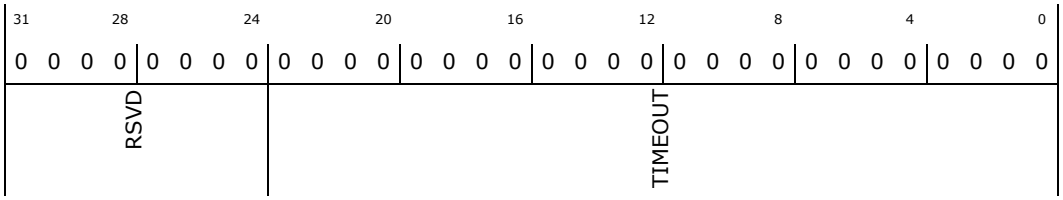
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.8.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

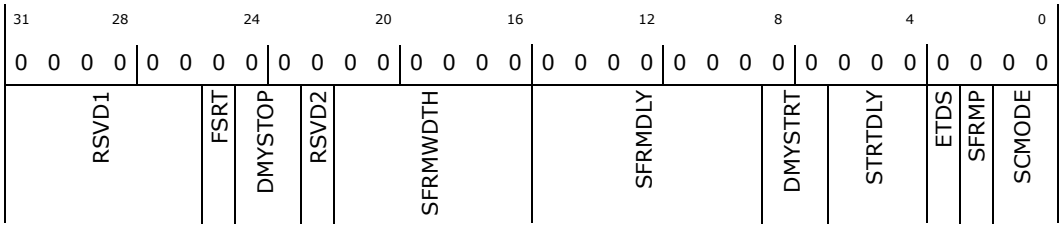
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.8.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

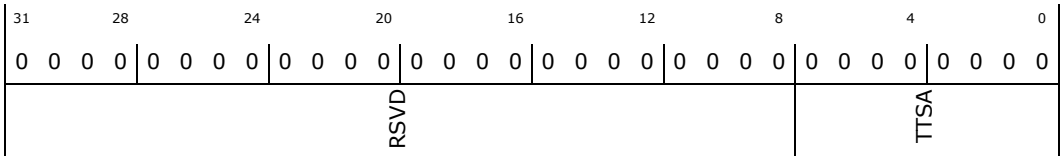
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.8.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

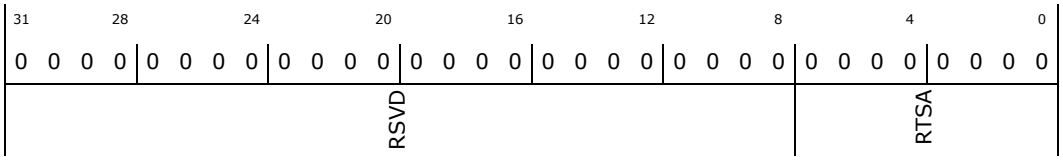
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.8.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

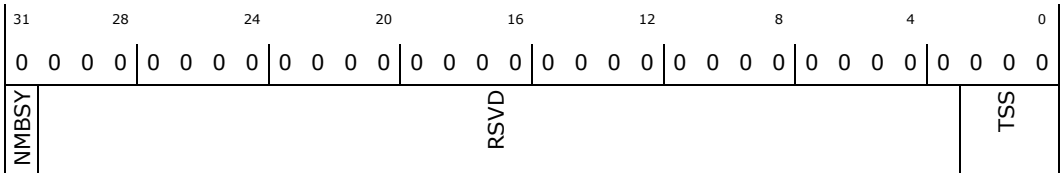
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.8.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

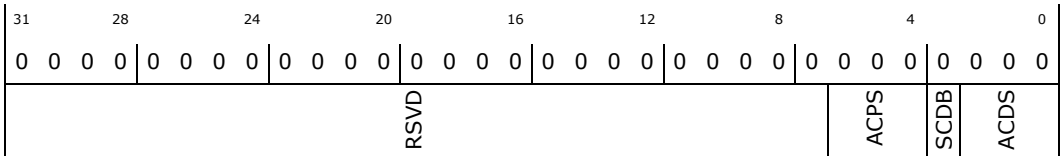
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.8.12 SSP Control 2 Register (SSCR2)—Offset 40h

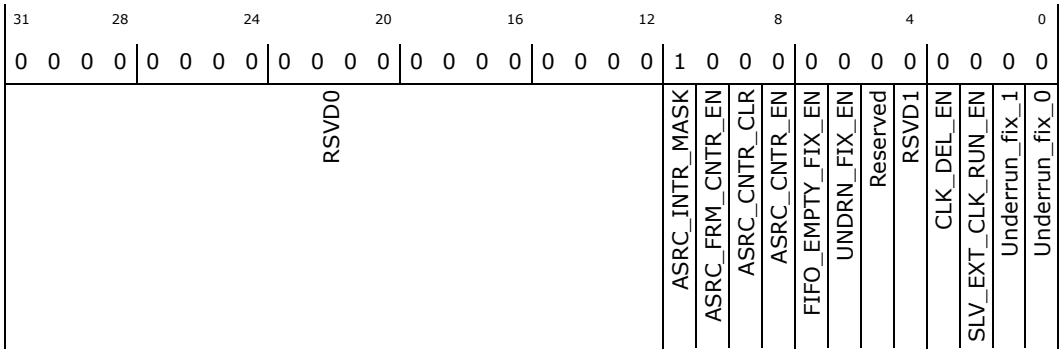
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.8.13 SSP Frame Select Register (SSFS)—Offset 44h

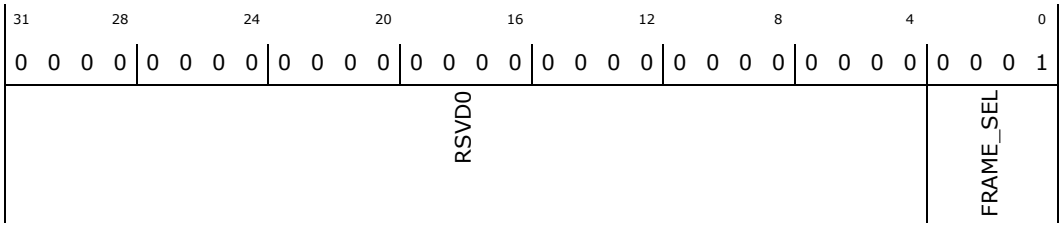
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.8.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

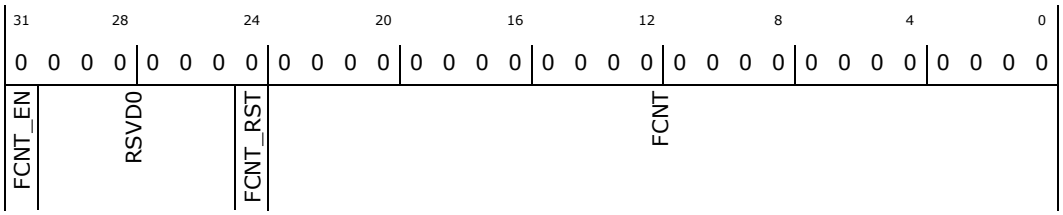
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A2000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.8.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

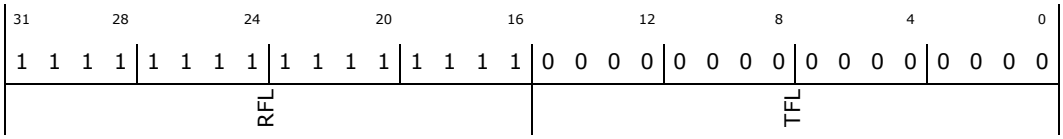
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.8.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

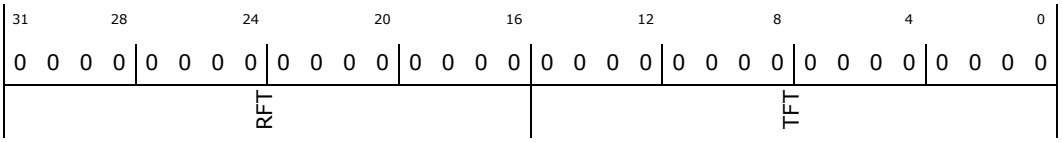
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A2000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.8.17 SSP Control 3 Register (SSCR3)—Offset 70h

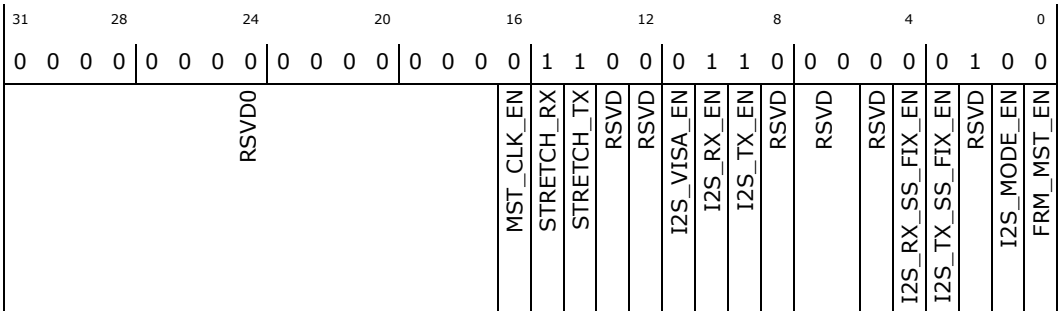
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

8.8.18 SSP Control 4 Register (SSCR4)—Offset 74h

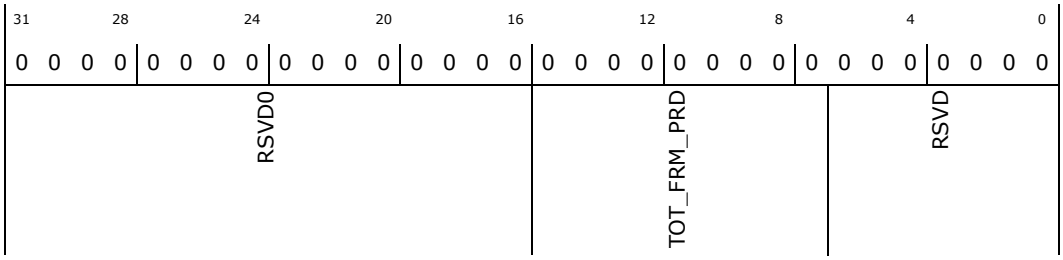
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A2000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.8.19 SSP Control 5 Register (SSCR5)—Offset 78h

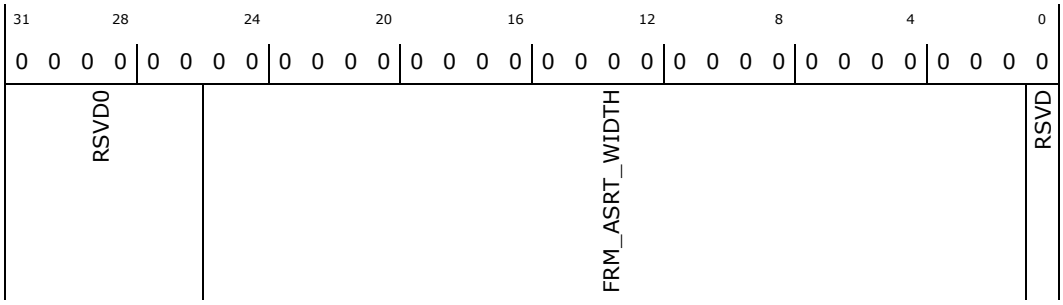
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

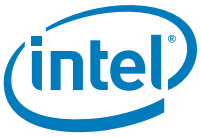
Offset: [Ipe_bridge.BAR + A2000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.



8.9 SIO SPI 3 Memory Mapped I/O Registers

Table 60. Summary of SIO SPI 3 Memory Mapped I/O Registers—lpe_bridge.BAR

8.9.1 SSP Control 0 Register (SSCR0)—Offset 0h

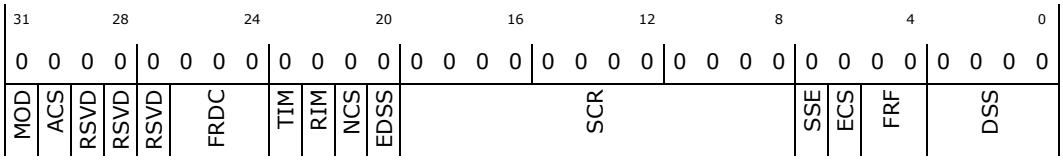
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.9.2 SSP Control 1 Register (SSCR1)—Offset 4h

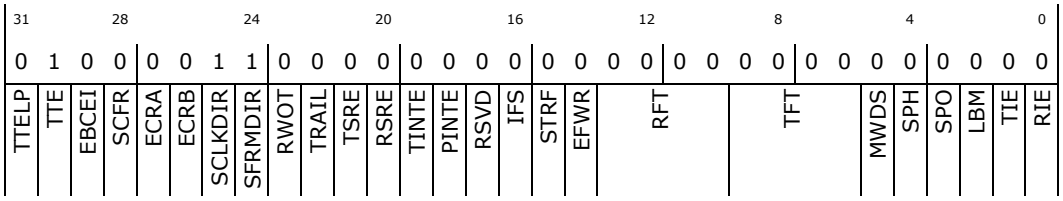
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.9.3 SSP Status Register (SSSR)—Offset 8h

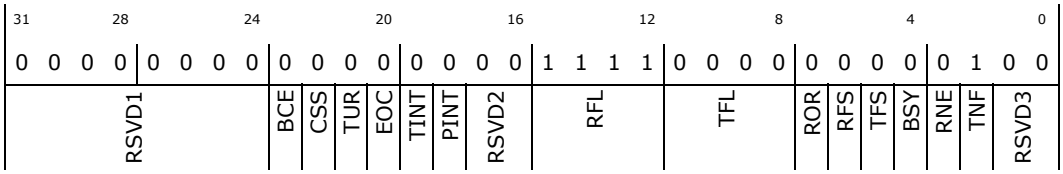
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0x0 RO	**Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0x0 RO	**Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0x0 RO	**Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	0x1 RO	**Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0x0 RO	**RSVD3:** Reserved

8.9.4 SSP Interupt Test Register (SSITR)—Offset Ch

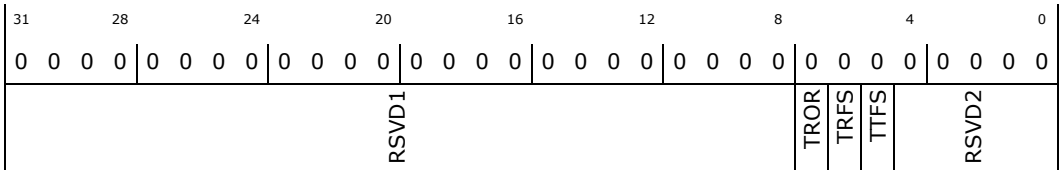
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.9.5 SSP Data Register (SSDR)—Offset 10h

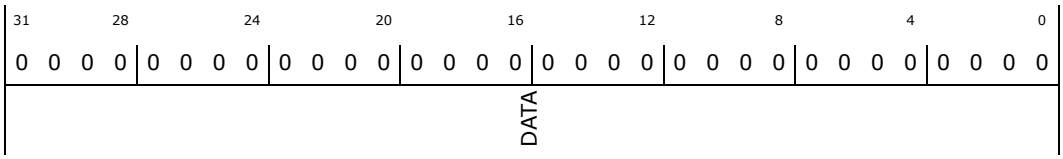
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.9.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

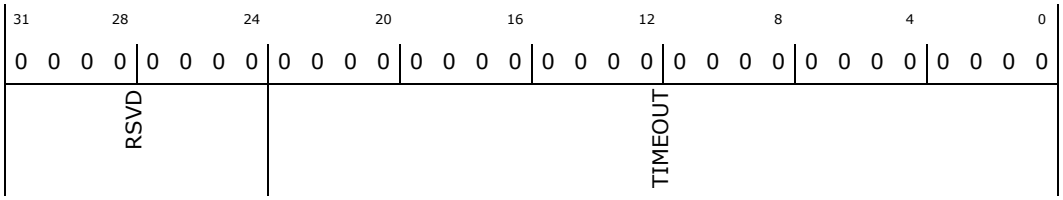
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.9.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

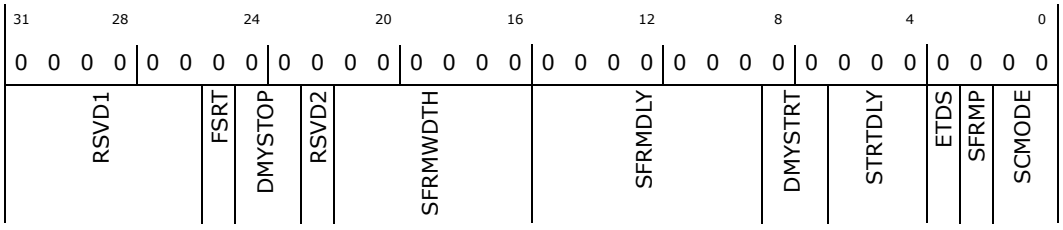
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.9.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

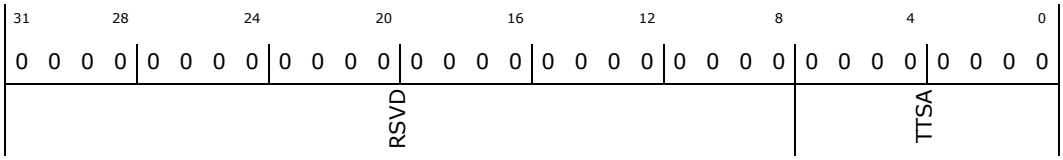
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.9.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

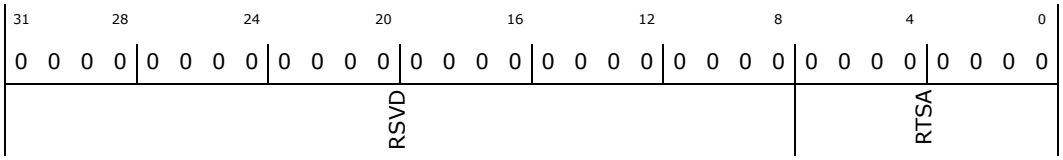
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.9.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

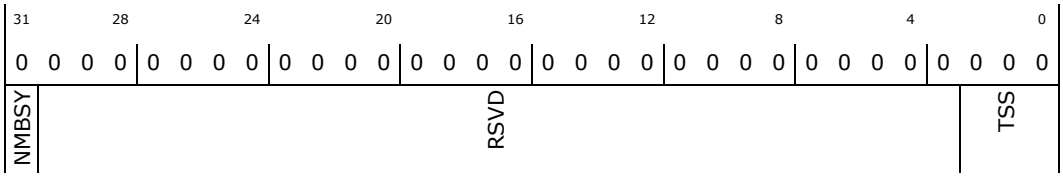
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.9.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

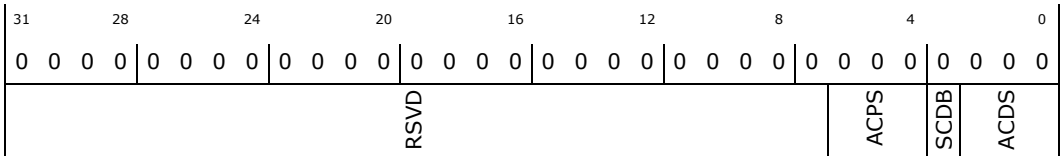
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.9.12 SSP Control 2 Register (SSCR2)—Offset 40h

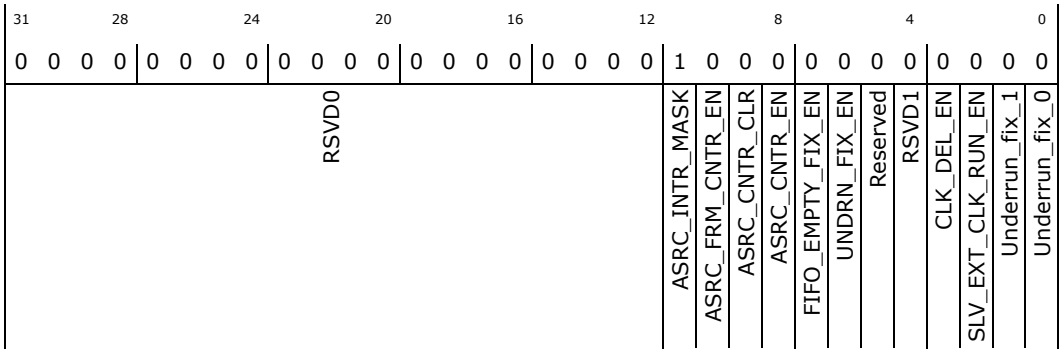
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.9.13 SSP Frame Select Register (SSFS)—Offset 44h

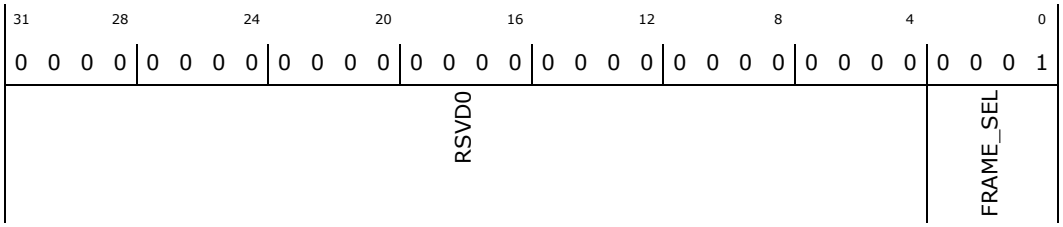
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.9.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

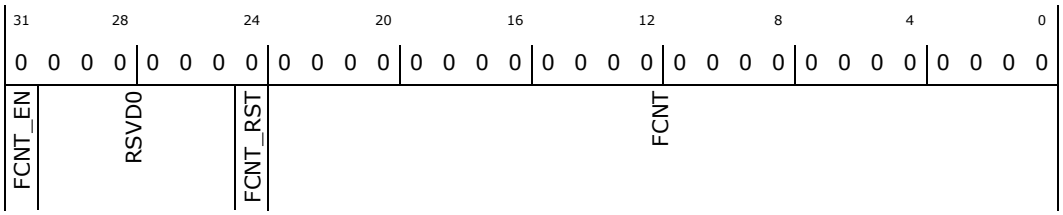
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A4000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.9.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

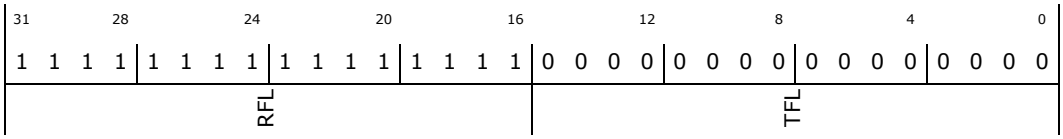
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.9.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

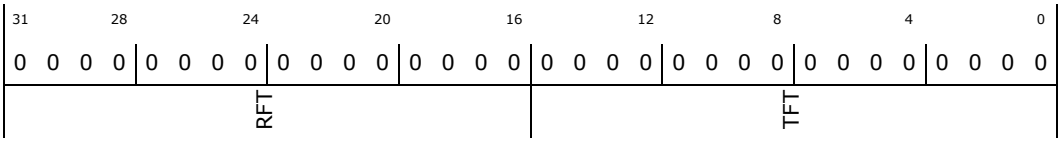
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A4000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.9.17 SSP Control 3 Register (SSCR3)—Offset 70h

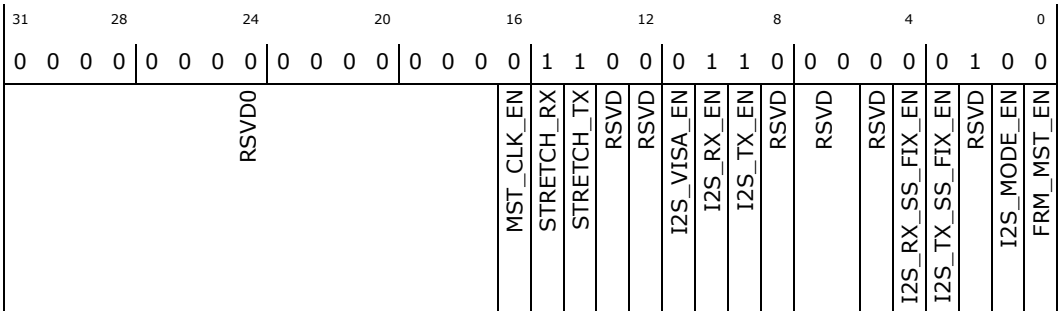
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

8.9.18 SSP Control 4 Register (SSCR4)—Offset 74h

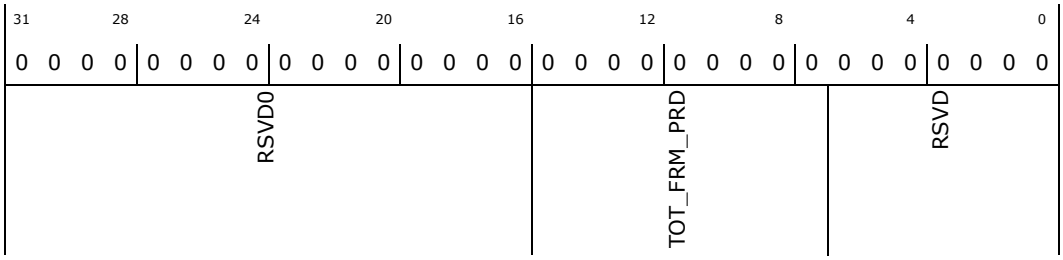
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A4000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.9.19 SSP Control 5 Register (SSCR5)—Offset 78h

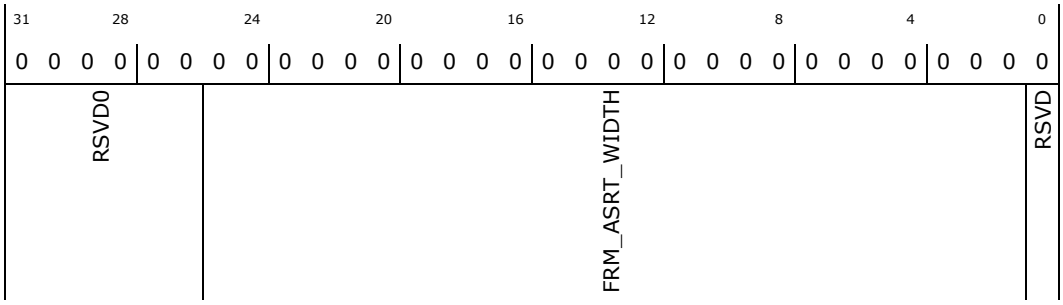
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

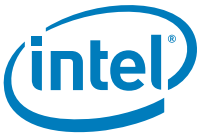
Offset: [Ipe_bridge.BAR + A4000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.



8.10 SIO SPI 4 Memory Mapped I/O Registers

Table 61. Summary of SIO SPI 4 Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SSP Control 0 Register (SSCR0)—Offset 0h" on page 3819	00000000h

8.10.1 SSP Control 0 Register (SSCR0)—Offset 0h

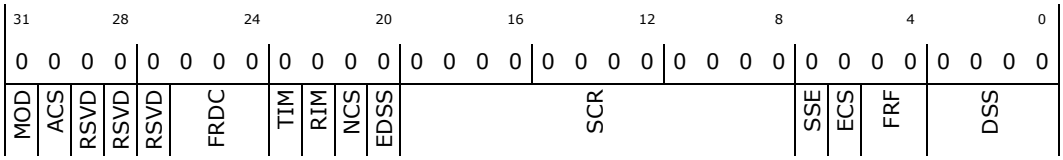
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.10.2 SSP Control 1 Register (SSCR1)—Offset 4h

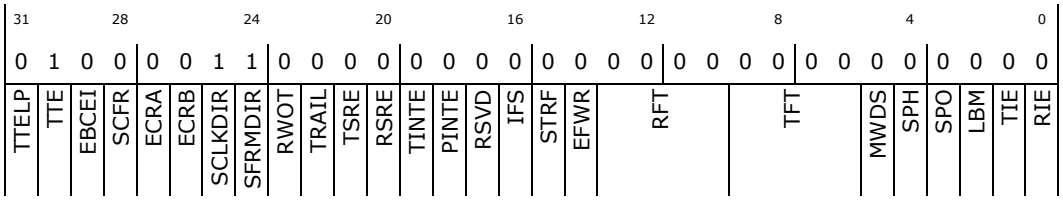
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.10.3 SSP Status Register (SSSR)—Offset 8h

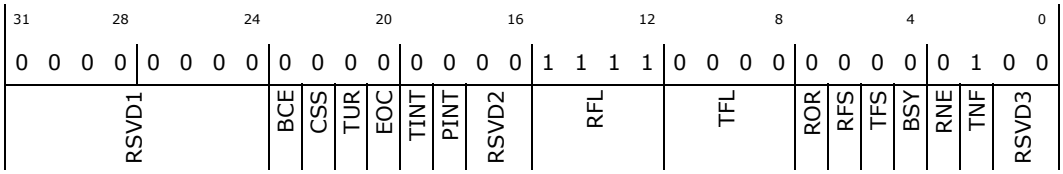
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0x0 RO	**Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0x0 RO	**Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0x0 RO	**Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	0x1 RO	**Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	0x0 RO	**RSVD3:** Reserved

8.10.4 SSP Interupt Test Register (SSITR)—Offset Ch

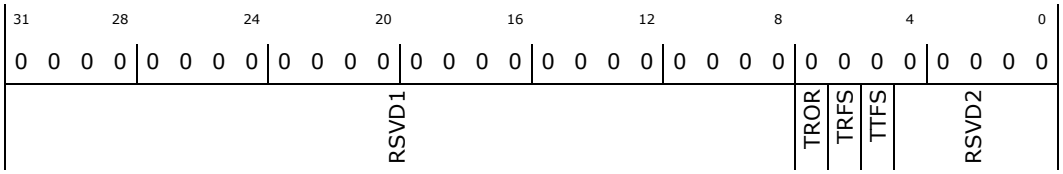
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.10.5 SSP Data Register (SSDR)—Offset 10h

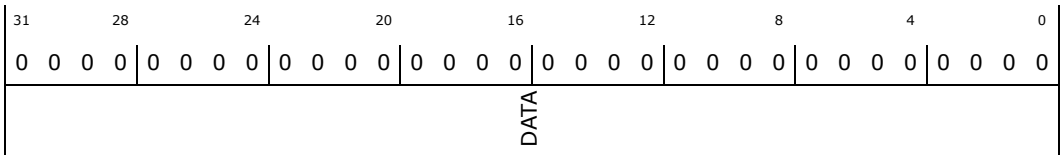
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.10.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

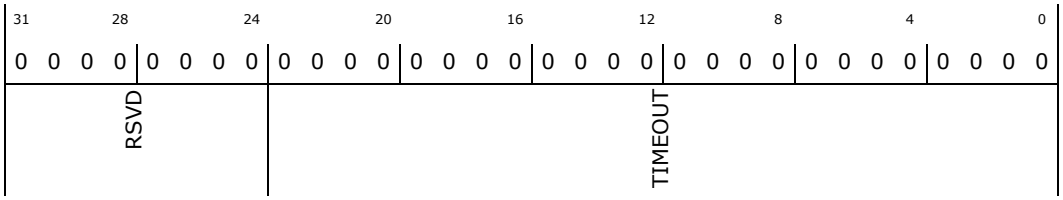
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.10.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

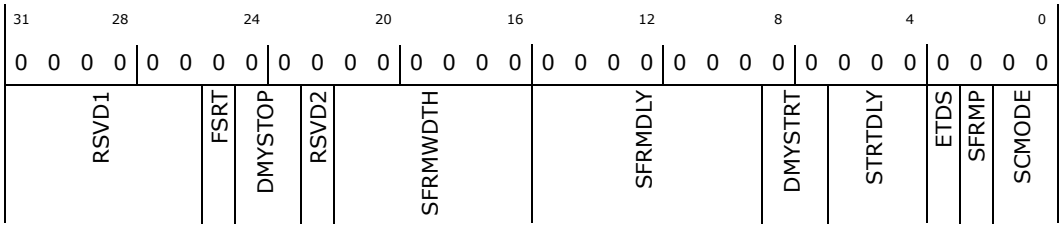
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.10.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

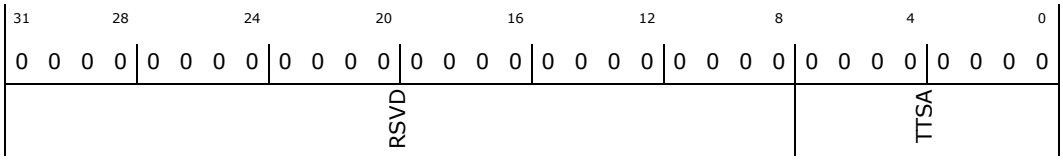
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.10.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

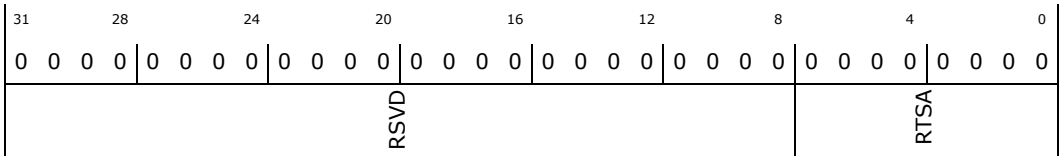
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.10.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

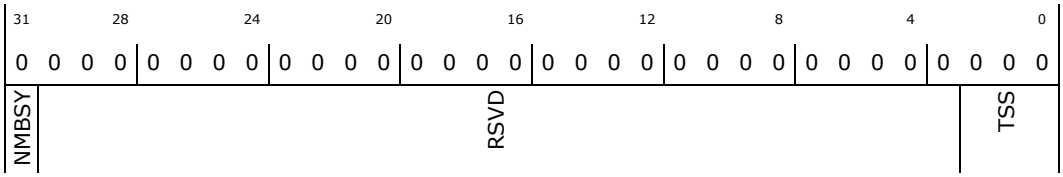
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.10.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

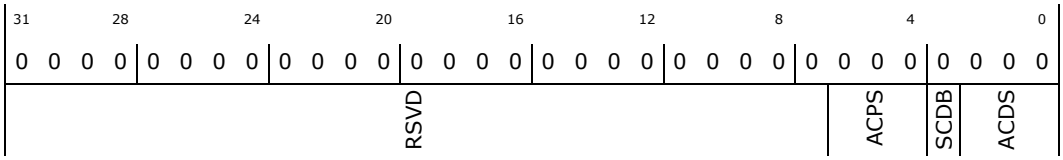
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.10.12 SSP Control 2 Register (SSCR2)—Offset 40h

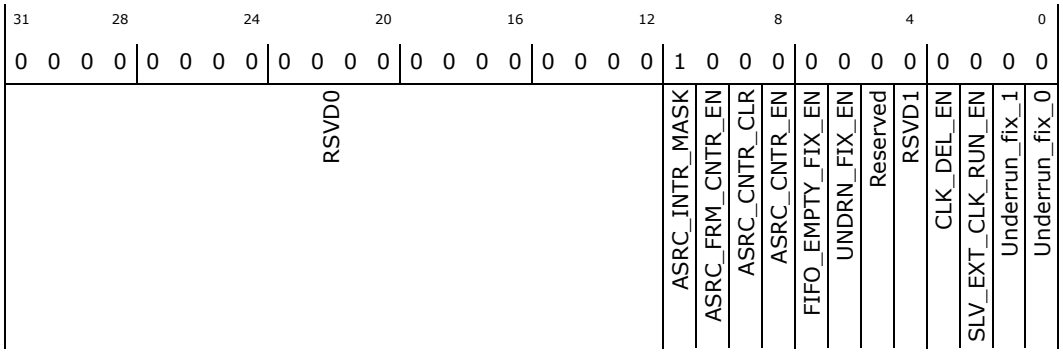
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.10.13 SSP Frame Select Register (SSFS)—Offset 44h

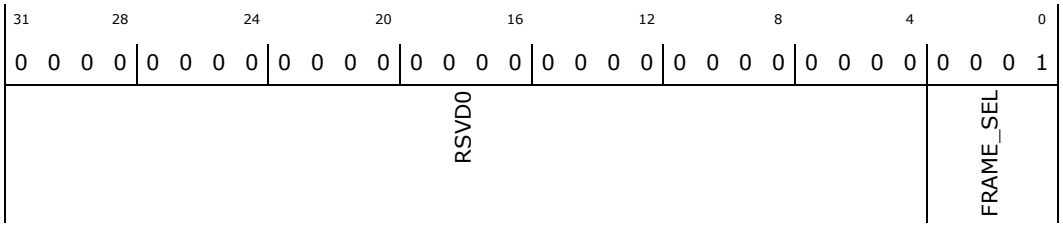
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.10.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

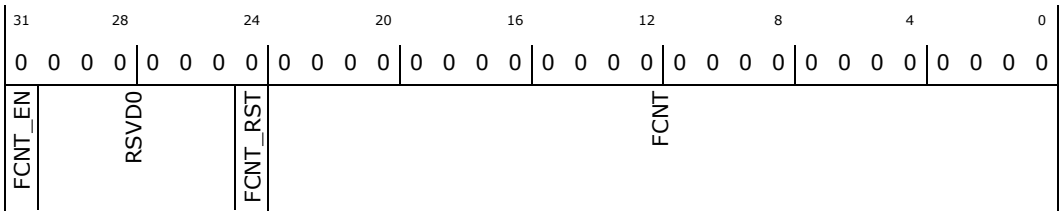
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A5000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.10.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

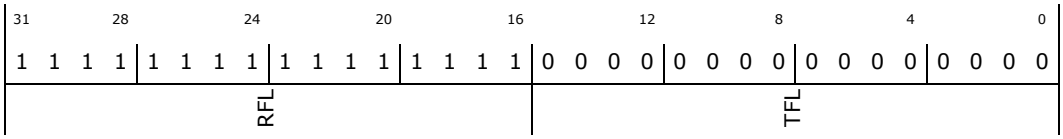
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.10.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

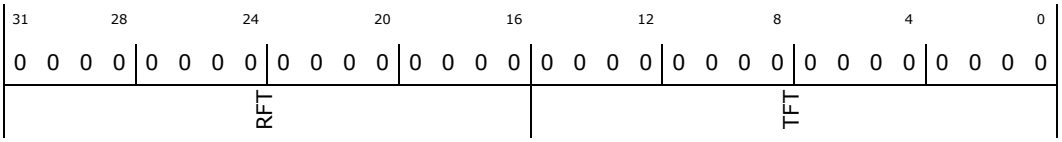
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A5000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.10.17 SSP Control 3 Register (SSCR3)—Offset 70h

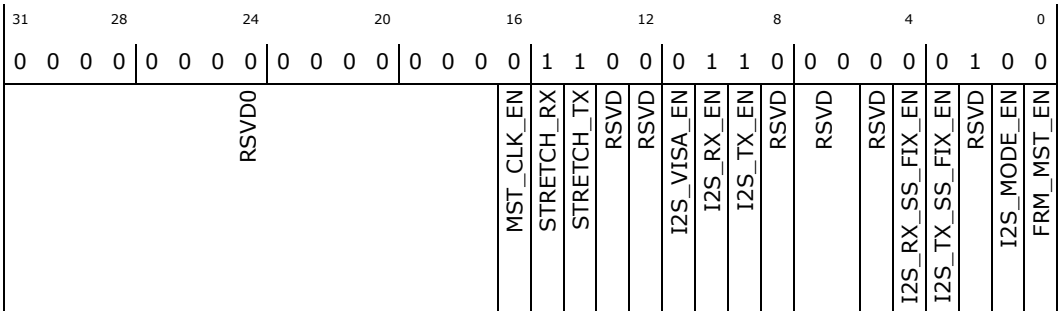
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

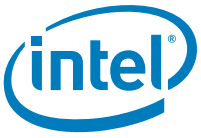
Offset: [Ipe_bridge.BAR + A5000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

8.10.18 SSP Control 4 Register (SSCR4)—Offset 74h

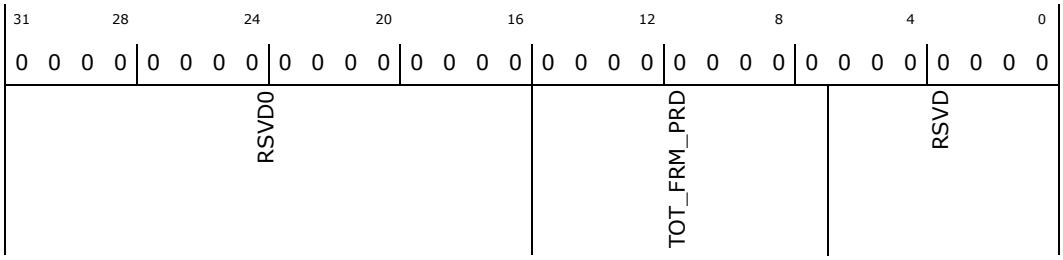
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A5000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.10.19 SSP Control 5 Register (SSCR5)—Offset 78h

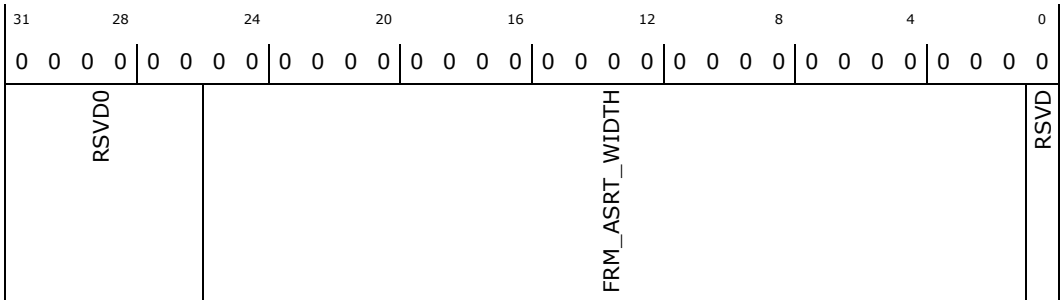
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

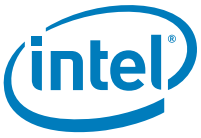
Offset: [Ipe_bridge.BAR + A5000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.



8.11 SIO SPI 5 Memory Mapped I/O Registers

8.11.1 SSP Control 0 Register (SSCR0)—Offset 0h

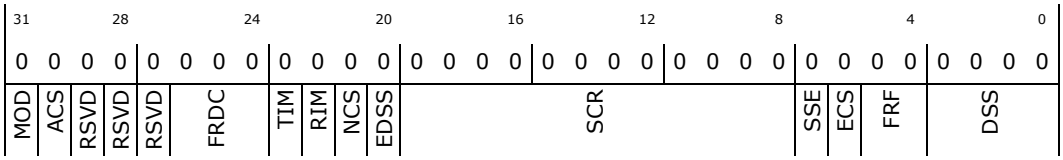
The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 0h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode
30	0x0 RW	**Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK)
29	0x0 RO	**Reserved (RSVD):** Reserved.
28	0x0 RO	**Reserved (RSVD):** Reserved.
27	0x0 RO	**Reserved (RSVD):** Reserved.
26:24	0x0 RW	**Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0x0 RW	**Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0x0 RW	**Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0x0 RW	**Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0x0 RW	**Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits

Bit Range	Default & Access	Field Name (ID): Description
19:8	0x0 RW	**Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0x0 RW	**Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0x0 RW	**External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0x0 RW	**Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0x0 RW	**Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

8.11.2 SSP Control 1 Register (SSCR1)—Offset 4h

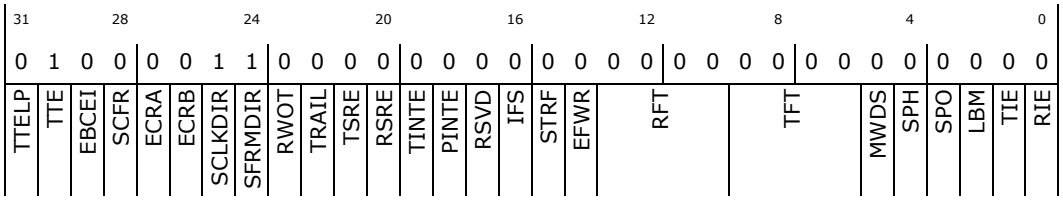
The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 4h

Default: 43000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped
30	0x1 RW	**TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data
29	0x0 RW	**Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RW	**Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers
27	0x0 RW	**Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
26	0x0 RW	**Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled
25	0x1 RW	**SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK
24	0x1 RW	**SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM
23	0x0 RW	**Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode
22	0x0 RW	**Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA
21	0x0 RW	**Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
20	0x0 RW	**Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled
19	0x0 RW	**Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled
18	0x0 RW	**Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled
17	0x0 RW	**RSVD:** Reserved
16	0x0 RW	**Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0x0 RW	**Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0x0 RW	**Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled

Bit Range	Default & Access	Field Name (ID): Description
13:10	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0x0 RW	**Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0x0 RW	**Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0x0 RW	**Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high
2	0x0 RW	**Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0x0 RW	**Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0x0 RW	**Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

8.11.3 SSP Status Register (SSSR)—Offset 8h

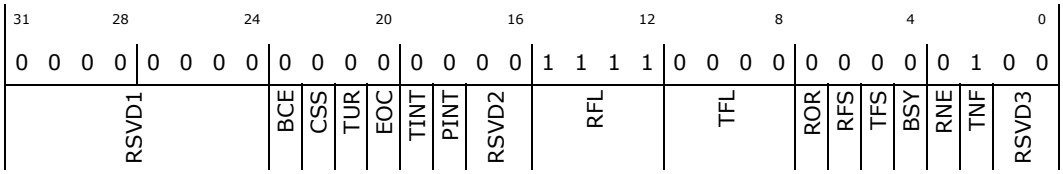
The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 8h

Default: 0000F004h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD1:** Reserved
23	0x0 RW/1C	**Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0
22	0x0 RO	**Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals
21	0x0 RW/1C	**Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0x0 RW/1C	**End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition
19	0x0 RW/1C	**Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending
18	0x0 RW/1C	**Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending
17:16	0x0 RO	**RSVD2:** Reserved
15:12	0xf RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
11:8	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status.
7	0x0 RW/1C	**Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt

1:0	0x0 RO	**RSVD3:** Reserved

8.11.4 SSP Interupt Test Register (SSITR)—Offset Ch

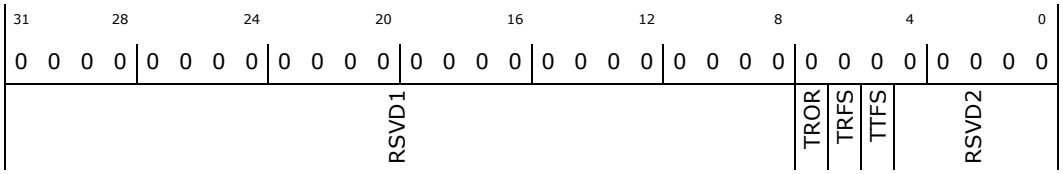
The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A6000h] + Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated
6	0x0 RW	**Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0x0 RO	**RSVD2:** Reserved

8.11.5 SSP Data Register (SSDR)—Offset 10h

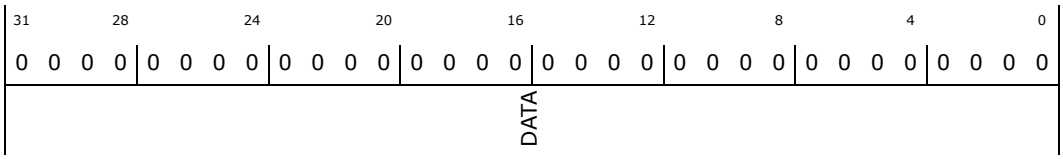
The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

8.11.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

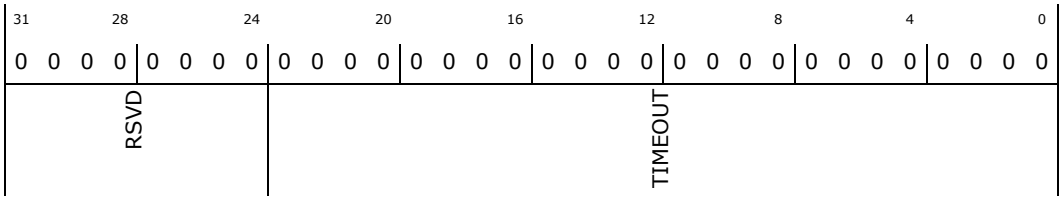
The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A6000h] + 28h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD:** Reserved
23:0	0x0 RW	**Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

8.11.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

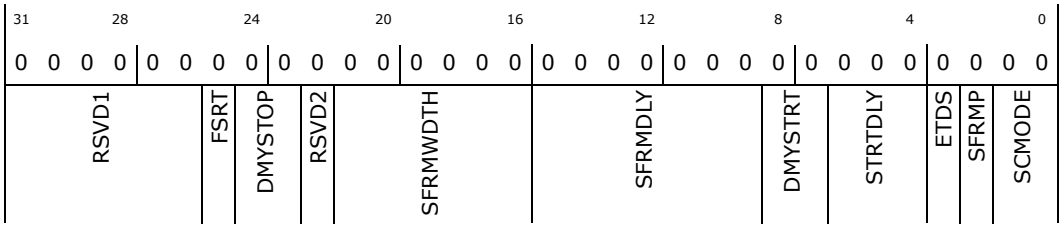
The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A6000h] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD1:** Reserved
25	0x0 RW	**Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame
24:23	0x0 RW	**Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data
22	0x0 RW	**RSVD2:** Reserved
21:16	0x0 RW	**Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38)
15:9	0x0 RW	**Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74)
8:7	0x0 RW	**Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data
6:4	0x0 RW	**Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods)
3	0x0 RW	**End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0)
2	0x0 RW	**Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high
1:0	0x0 RW	**Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high)

8.11.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

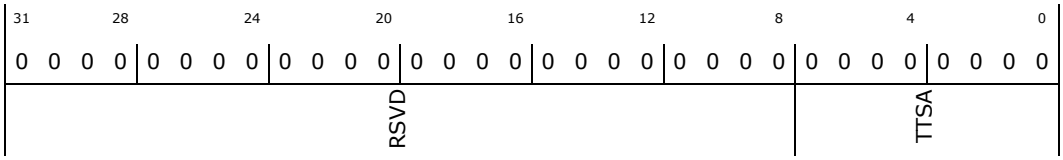
The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot

8.11.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

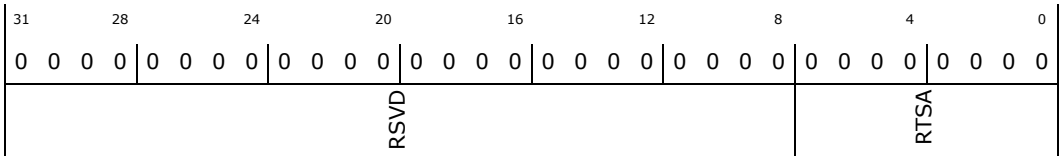
The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD:** Reserved
7:0	0x0 RW	**RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

8.11.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

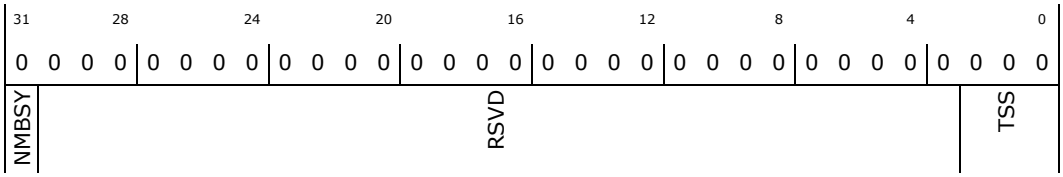
The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 38h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0x0 RO	**RSVD:** Reserved
2:0	0x0 RO	**Time Slot Status (TSS):** Value indicates which time slot is currently active

8.11.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

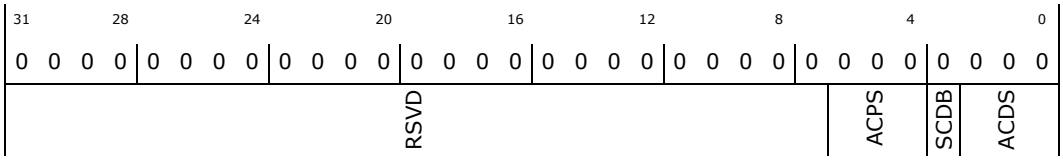
The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 3Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0x0 RW	**Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved
3	0x0 RW	**SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	0x0 RW	**Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

8.11.12 SSP Control 2 Register (SSCR2)—Offset 40h

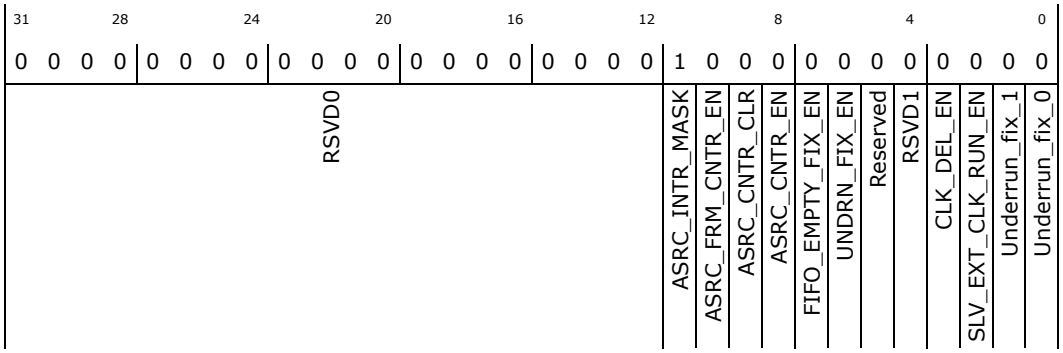
The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 40h

Default: 00000800h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11	0x1 RW	**ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold.
10	0x0 RW	**ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/AC	**ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0x0 RW	**ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	0x0 RW	**Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	0x0 RW	**Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5	0x0 RW	**Reserved:** This is a RW bit with no effect on IP behavior
4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW	**Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0x0 RW	**Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0x0 RW	**Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0x0 RW	**Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

8.11.13 SSP Frame Select Register (SSFS)—Offset 44h

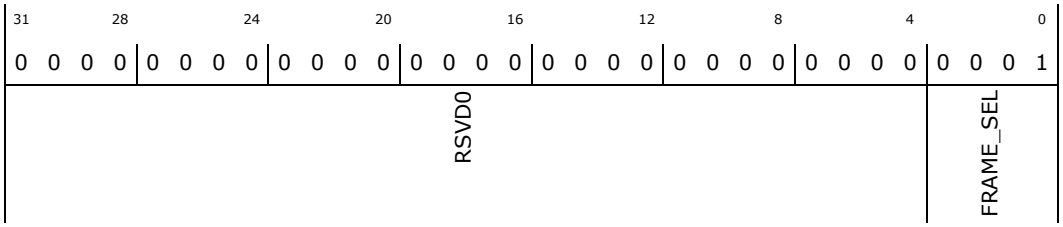
The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 44h

Default: 00000001h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3:0	0x1 RW	**Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

8.11.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

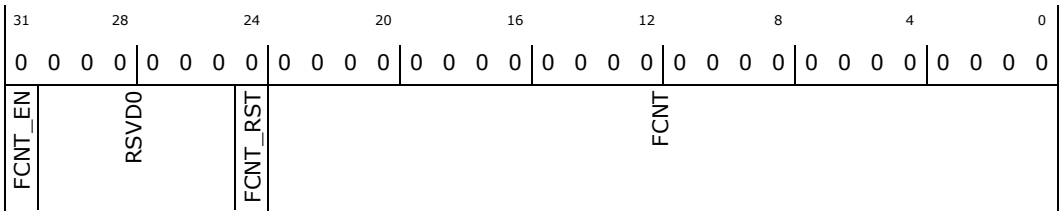
The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset[0-7]: [Ipe_bridge.BAR + A6000h] + 48h + [0-7]*4h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
24	0x0 WO	**Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	0x0 RO	**Slot Frame Count (FCNT):** SSP frame count.

8.11.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

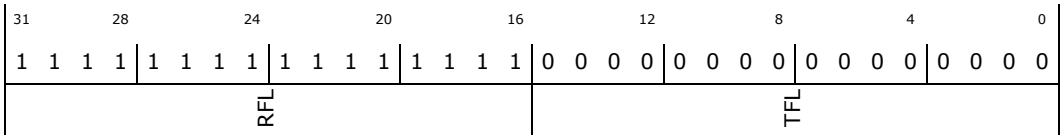
The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A6000h] + 68h

Default: FFFF0000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0xffff RO	**Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0x0 RO	**Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

8.11.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

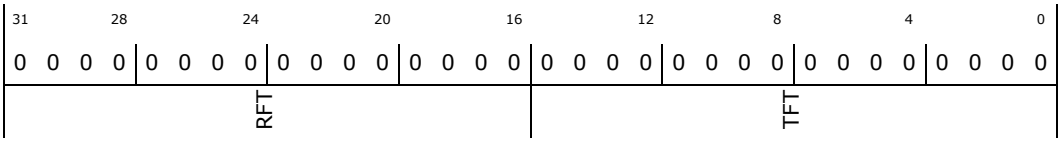
The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [lpe_bridge.BAR + A6000h] + 6Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1)
15:0	0x0 RW	**Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.

8.11.17 SSP Control 3 Register (SSCR3)—Offset 70h

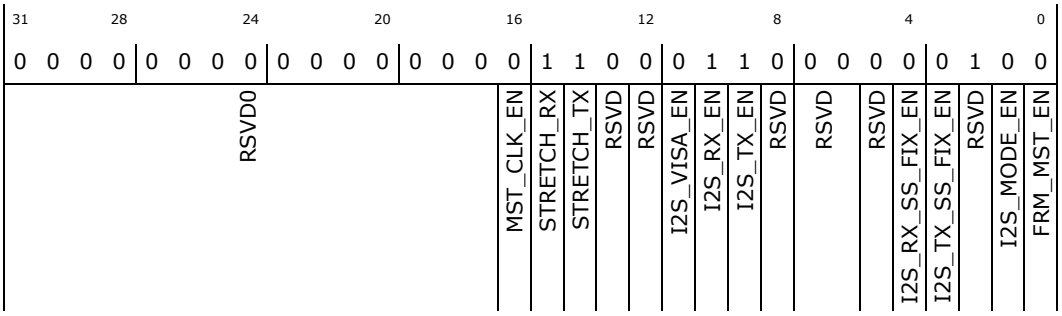
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [Ipe_bridge.BAR + A6000h] + 70h

Default: 0000C604h



Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0.
15	0x1 RW	**Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
14	0x1 RW	**Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.
13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW	**I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	0x1 RW	**I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	0x1 RW	**I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0x0 RO	**Reserved (RSVD):** Reserved.
7:6	0x0 RO	**Reserved (RSVD):** Reserved.
5	0x0 RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0x0 RW	**I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	0x1 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW	**I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0x0 RW	**Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

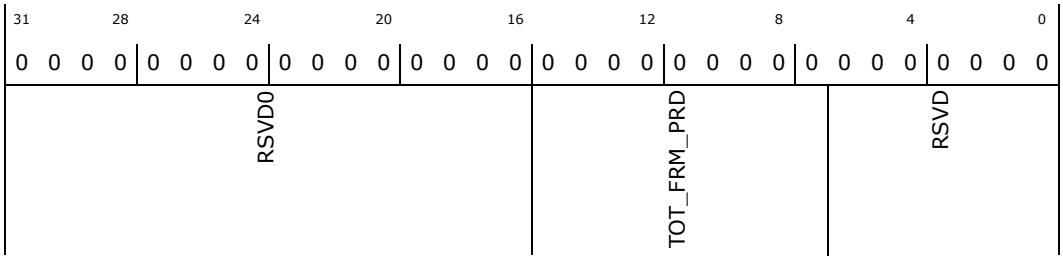
8.11.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **Offset:** [Ipe_bridge.BAR + A6000h] + 74h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:7	0x0 RW	**Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal
6:0	0x0 RO	**Reserved (RSVD):** Reserved.

8.11.19 SSP Control 5 Register (SSCR5)—Offset 78h

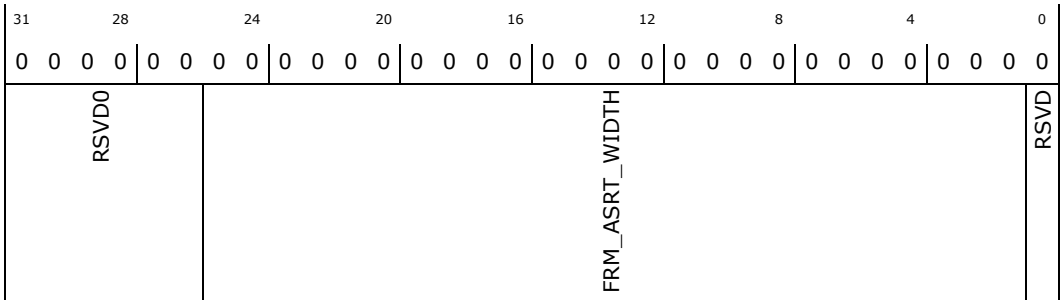
Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

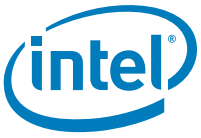
Offset: [Ipe_bridge.BAR + A6000h] + 78h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
25:1	0x0 RW	**Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.
0	0x0 RO	**Reserved (RSVD):** Reserved.



8.12 LPE Audio Memory Mapped I/O Registers

Table 63. Summary of LPE Audio Memory Mapped I/O Registers—lpe_bridge.BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–7h	8	"reg_CSR_type (CSR)—Offset 0h" on page 3864	0000790001E40001h
8–Fh	8	"reg_XT_PISR_type (PISR)—Offset 8h" on page 3866	0000000000000000h

1	0x0 RW	**IA_LPE_IPC_Request_Mask:** IPCIA interrupt Enable to LPE
0	0x0 RW	**IA_LPE_IPC_Done_Mask:** IPCLPEIA interrupt Enable to LPE

8.12.8 reg_IPCX_type (IPCX)—Offset 38h

The Inter-process Status and Message register for IA-32 contains a message sent from the IA-32 CPU to LPE. The format of the CPU message bits (61:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCIA is not

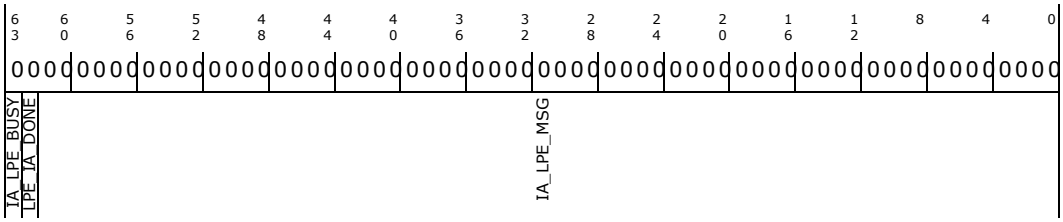
empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPEIA. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The IA-32 CPU must not attempt to write into IPCIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 38h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IA_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message
62	0x0 RW	**LPE_IA_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention
61:0	0x0 RW	**IA_LPE_MSG:** IA-32 to LPE Message

8.12.9 reg_IPCD_type (IPCD)—Offset 40h

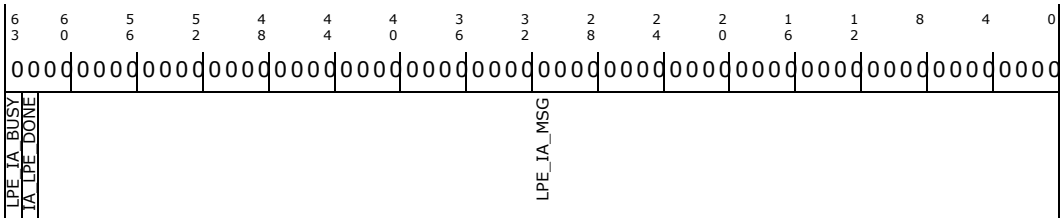
Inter-process Status and Message register for LPE contains a message sent from LPE to IA-32 CPU. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When IA-32 CPU reads the message code from the register, and writes back with the bit 63 cleared. When the IA-32 CPU processes the message sent by LPE, it may set bit 63 in IPCD to assert interrupt request to LPE. The LPE must not attempt to write into IPCLPEIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 40h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**LPE_IA_BUSY:** Busy. When this bit is cleared, the IA CPU is Ready to accept a new message
62	0x0 RW	**IA_LPE_DONE:** Done. When the bit is set, the IA CPU completed operation and requests attention from LPE
61:0	0x0 RW	**LPE_IA_MSG:** LPE to IA CPU Message

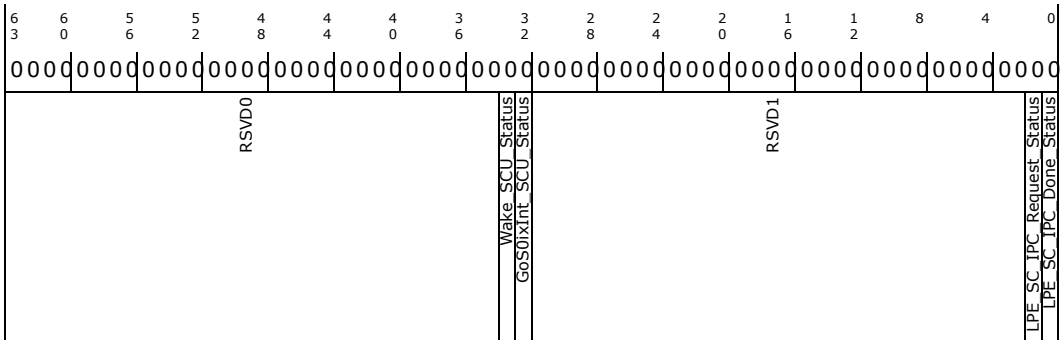
8.12.10 reg_ISRSC_type (ISRSC)—Offset 48h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 48h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:34	0x0 RO	**RSVD0:** Reserved
33	0x0 RW/1C	**Wake_SCU_Status:** This bit is set by hardware when a blocked transaction is detected. It generates a wake to the SCU
32	0x0 RW/1C	**GoS0ixInt_SCU_Status:** This bit is set by expiry of the Re-entry timer. The bit gets set only if GoS0ixInt_En bit is set and this interrupt is unmasked.
31:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RO	**LPE_SC_IPC_Request_Status:** IPCLPESC Interrupt Request 1: interrupt when LPE writes a message into IPCLPESC register with bit 63 set 0: Deasserted
0	0x0 RW/1C	**LPE_SC_IPC_Done_Status:** IPCSC Interrupt Request 1: interrupt when LPE writes a message into IPCSC register with bit 62 set is asserted 0: Deasserted.

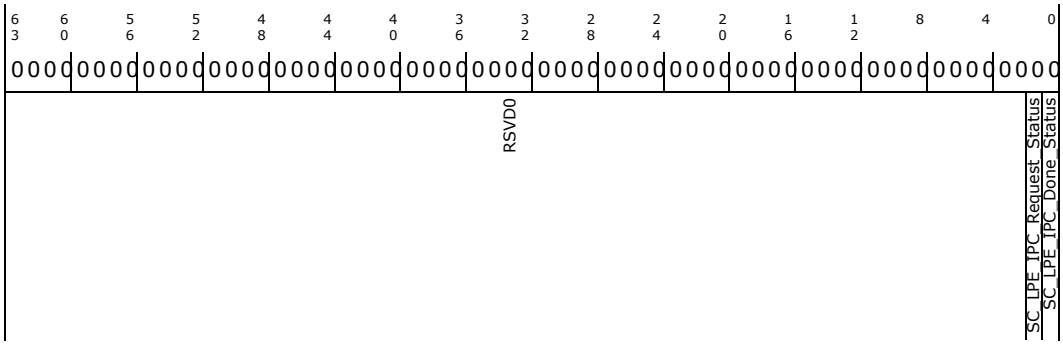
8.12.11 reg_ISRLPESC_type (ISRLPESC)—Offset 50h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 50h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RO	**SC_LPE_IPC_Request_Status:** IPCSC Interrupt Request to LPE 1: interrupt when SC writes a message into IPCSC register with bit 63 set. 0: Deasserted
0	0x0 RO	**SC_LPE_IPC_Done_Status:** IPCLPESC Interrupt Request to LPE 1: interrupt when SC CPU writes a message into IPCLPEIA register with bit 62 set is asserted 0: Deasserted.

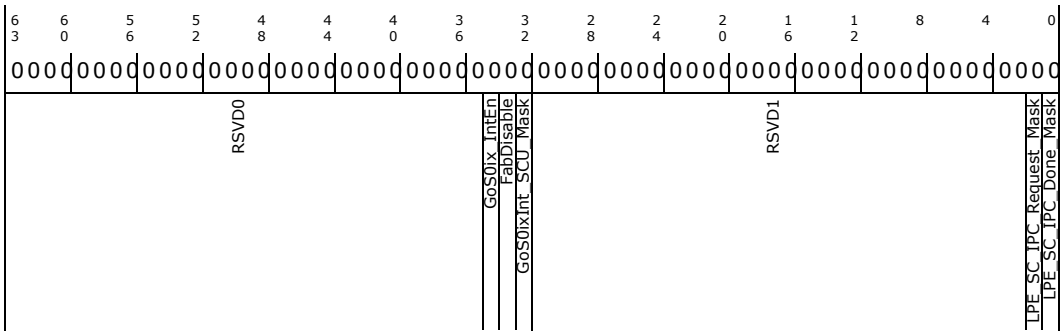
8.12.12 reg_IMRSC_type (IMRSC)—Offset 58h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 58h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:35	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
34	0x0 RW/1C	**GoS0ix_IntEn:** This bit indicates that Reentry to S0iX interrupts to SCU are enabled. The bit is set by hardware when a transaction is blocked at the Audio to Secondary interface due to the secondary fabric being gated and the fabdisable bit being set. Software is expected to clear this bit along with the Secondary Fabric Reject bit. This disables the interrupts.
33	0x0 RW	**FabDisable:** This bit is used to generate the wake interrupt to SCU. When set the interrupt generation is enabled. When cleared the interrupt generation is disabled
32	0x0 RW	**GoS0ixInt_SCU_Mask:** Mask bit for S0ix Reentry interrupt to SCU
31:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**LPE_SC_IPC_Request_Mask:** IPCLPESC Interrupt Enable to SC CPU
0	0x0 RW	**LPE_SC_IPC_Done_Mask:** IPCSC Interrupt Enable to SC CPU

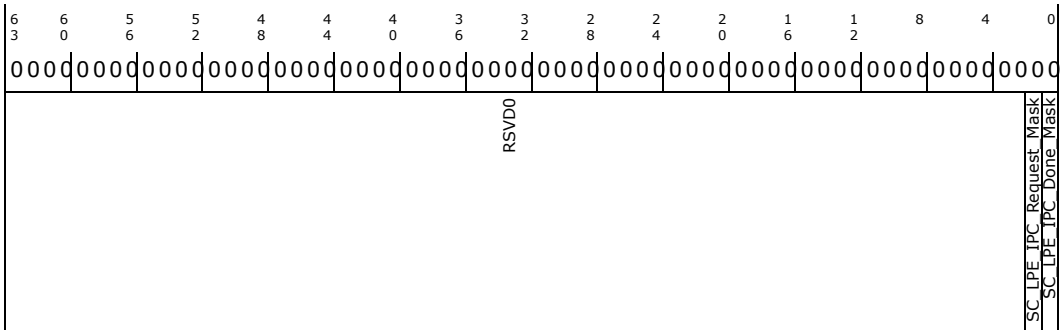
8.12.13 reg_IMRLPESC_type (IMRLPESC)—Offset 60h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 60h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW	**SC_LPE_IPC_Request_Mask:** IPCSC interrupt Enable to LPE
0	0x0 RW	**SC_LPE_IPC_Done_Mask:** IPCLPESC interrupt Enable to LPE

8.12.14 reg_IPCSC_type (IPCSC)—Offset 68h

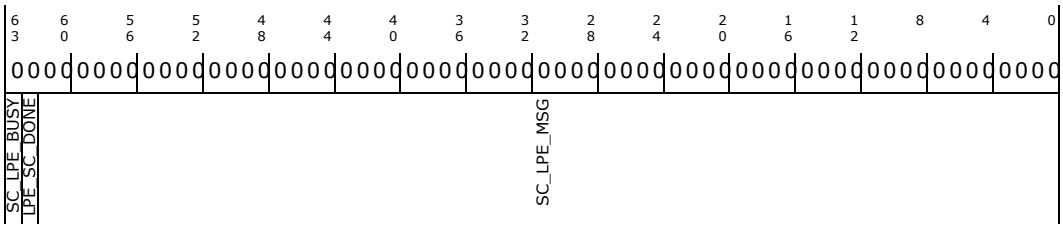
The Inter-process Status and Message register for SC contains a message sent from the SC CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCSC is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPESC. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The SC CPU must not attempt to write into IPCIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 68h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**SC_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message
62	0x0 RW	**LPE_SC_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention
61:0	0x0 RW	**SC_LPE_MSG:** SC to LPE Message

8.12.15 reg_IPCLPESC_type (IPCLPESC)—Offset 70h

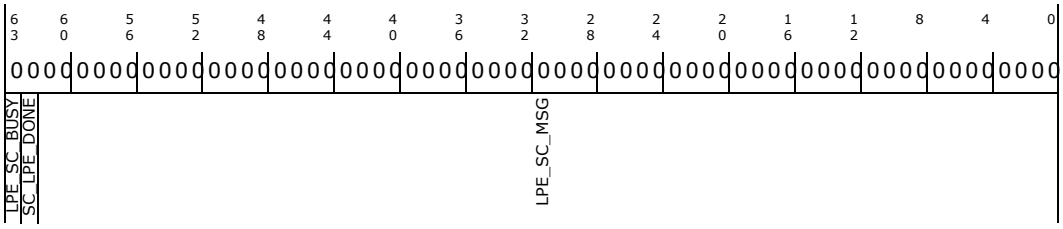
Inter-process Status and Message register for LPE contains a message sent from LPE to SC. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When SC reads the message code from the register, and writes back with the bit 63 cleared. When the SC CPU processes the message sent by LPE, it may set bit 62 in IPCLPESC to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 70h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**LPE_SC_BUSY:** Busy. When this bit is cleared, the SC CPU is Ready to accept a new message
62	0x0 RW	**SC_LPE_DONE:** Done. When the bit is set, the SC CPU completed operation and requests attention from LPE
61:0	0x0 RW	**LPE_SC_MSG:** LPE to SC CPU Message

8.12.16 reg_CLKCTL_type (CLKCTL)—Offset 78h

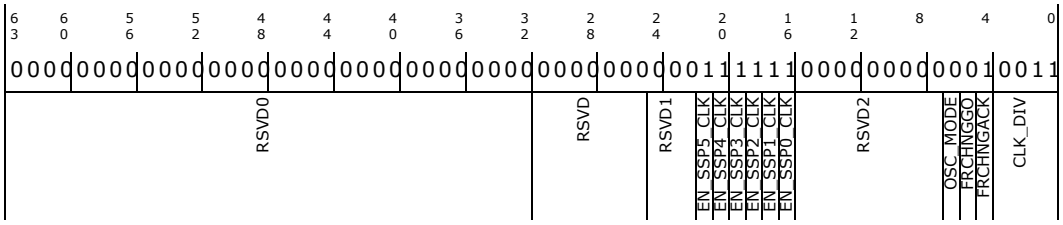
LPE Clock Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 78h

Default: 00000000003F0013h



Bit Range	Default & Access	Field Name (ID): Description
63:32	0x0 RO	**RSVD0:** Reserved
31:25	0x0 RO	**RSVD:** Reserved.
24:22	0x0 RO	**RSVD1:** Reserved
21	0x1 RW	**EN_SSP5_CLK:** clock output enable
20	0x1 RW	**EN_SSP4_CLK:** clock output enable
19	0x1 RW	**EN_SSP3_CLK:** clock output enable

Bit Range	Default & Access	Field Name (ID): Description
18	0x1 RW	**EN_SSP2_CLK:** clock output enable
17	0x1 RW	**EN_SSP1_CLK:** clock output enable
16	0x1 RW	**EN_SSP0_CLK:** clock output enable
15:7	0x0 RO	**RSVD2:** Reserved
6	0x0 RO	**OSC_MODE:** 1 indicates that PLL is turned off
5	0x0 RW/1S	**FRCHNGGO:** Go bit indicating that the value in 2:0 can be applied to core. This bit will get cleared on the rising edge of the ack from Clock Control Unit.
4	0x1 RO	**FRCHNGACK:** Sets on the falling edge of ack. A 1'b1 indicates that the frequency change is done. The bit auto clears on the rising edge of frequency change request.
3:0	0x3 RW	**CLK_DIV:** 0000: 19.2 MHz 0001: 19.2 Mhz 0010: 38.4 Mhz 0011: 50 Mhz 0100: 100 Mhz 0101: 200 Mhz 0110: 250 Mhz 0111: 333 Mhz 1000: 50 Mhz (SUS-RO) 1001: 100 Mhz (SUS-RO) 1010: Reserved 1011: Reserved 1100: Reserved 1101: Reserved 1110: Reserved 1111: Reserved

8.12.17 reg_FR_LAT_REQ_type (FR_LAT_REQ)—Offset 80h

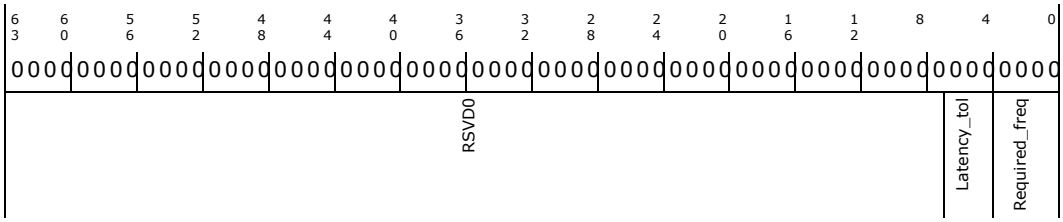
LPE

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 80h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:7	0x0 RO	**RSVD0:** Reserved
6:4	0x0 RW	**Latency_tol:** Latency tolerance for Cache Misses is listed here. SCU firmware is required to read this register and make a decision on whether it can enter a lower power state and still meet the latency tolerance.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RW	**Required_freq:** The following encoding specifies the frequency that the Audio Cluster requires for current operations. 0000: 19.2 MHz 0001: 19.2 Mhz 0010: 38.4 Mhz 0011: 50 Mhz 0100: 100 Mhz 0101: 200 Mhz 0110: 250 Mhz 0111: 333 Mhz 1000: 50 Mhz (SUS-RO) 1001: 100 Mhz (SUS-RO) 1010: Reserved 1011: Reserved 1100: Reserved 1101: Reserved 1110: Reserved 1111: Reserved Please note, that this does not guarantee that this frequency will be generated from the CCU. The SCU firmware is required to read this register before making a decision on entering lower power states.

8.12.18 reg_CHICKEN_BITS_type (CHICKEN_BITS)—Offset 88h

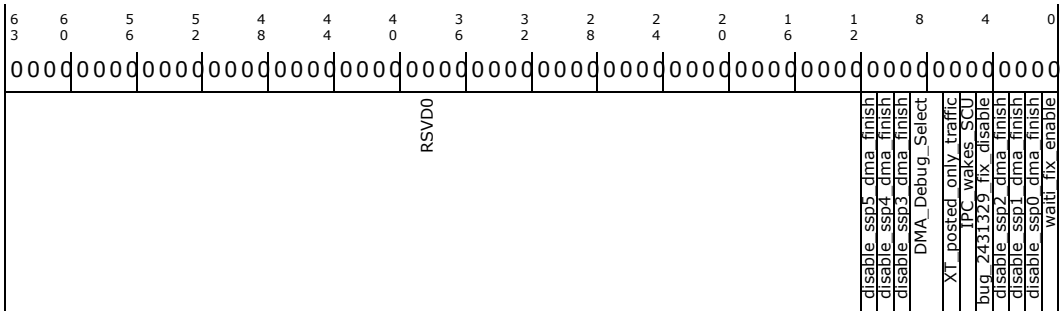
LPE

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 88h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RO	**RSVD0:** Reserved
11	0x0 RW	**disable_ssp5_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
10	0x0 RW	**disable_ssp4_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
9	0x0 RW	**disable_ssp3_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
8:7	0x0 RW	**DMA_Debug_Select:** Setting this bit will select DMA 1 debug signals to be routed to the VISA Mux.
6	0x0 RW	**XT_posted_only_traffic:** Setting this bit will select make all the traffic from Tensilica to be posted.
5	0x0 RW	**IPC_wakes_SCU:** Setting this to 1 will cause the IPC to be fed into the wake cone for SCU.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**bug_2431329_fix_disable:** Setting this to 1 will disable the synopsys compatible hardware handshake mechanism. Keep this set to 0 for regular hardware handshake operation.
3	0x0 RW	**disable_ssp2_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
2	0x0 RW	**disable_ssp1_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
1	0x0 RW	**disable_ssp0_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
0	0x0 RW	**waiti_fix_enable:** Setting this bit to 1 makes the frequency change request to be valid only if the core is in WAITI.

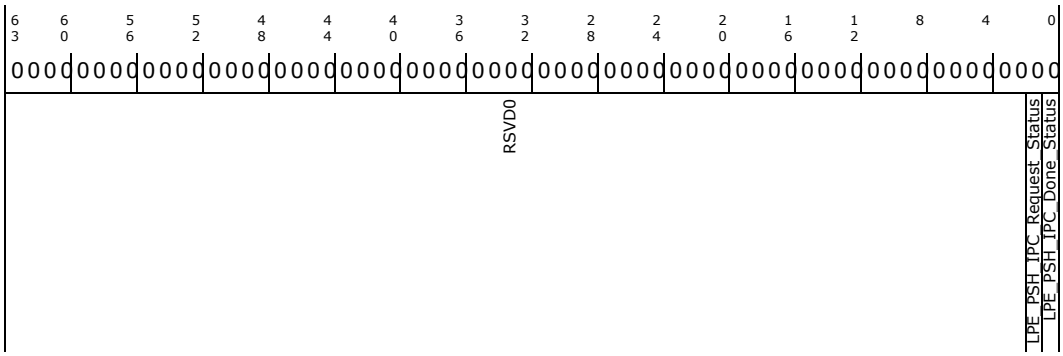
8.12.19 reg_ISRPSH_type (ISRPSH)—Offset 90h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 90h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RO	**LPE_PSH_IPC_Request_Status:** IPCLPEPSH Interrupt Request 1: interrupt when LPE writes a message into IPCLPEPSH register with bit 63 set 0: Deasserted
0	0x0 RW/1C	**LPE_PSH_IPC_Done_Status:** IPCPSH Interrupt Request 1: interrupt when LPE writes a message into IPCPSH register with bit 62 set is asserted 0: Deasserted.

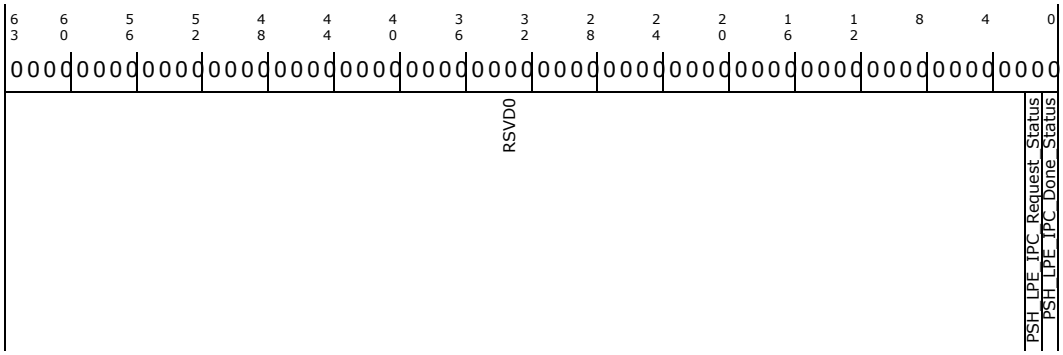
8.12.20 reg_ISRLPEPSH_type (ISRLPEPSH)—Offset 98h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + 98h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RO	**PSH_LPE_IPC_Request_Status:** IPCPSH Interrupt Request to LPE 1: interrupt when PSH writes a message into IPCPSH register with bit 63 set. 0: Deasserted
0	0x0 RO	**PSH_LPE_IPC_Done_Status:** IPCLPEPSH Interrupt Request to LPE 1: interrupt when PSH CPU writes a message into IPCLPEIA register with bit 62 set is asserted 0: Deasserted.

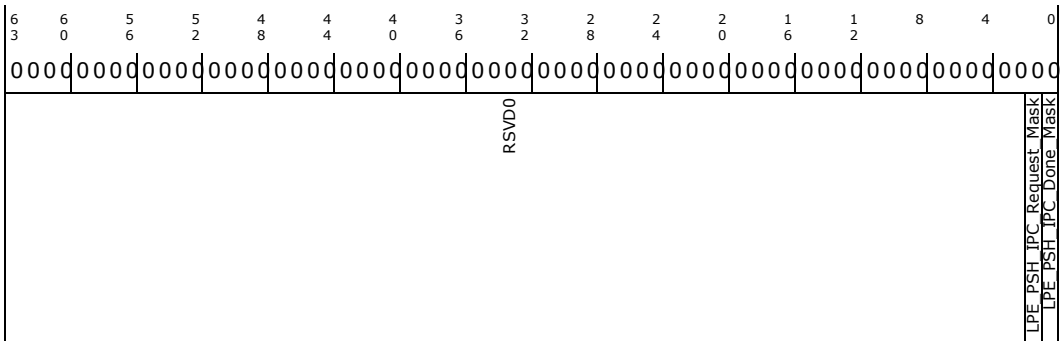
8.12.21 reg_IMRPSH_type (IMRPSH)—Offset A0h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + A0h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW	**LPE_PSH_IPC_Request_Mask:** IPCLPEPSH Interrupt Enable to PSH CPU
0	0x0 RW	**LPE_PSH_IPC_Done_Mask:** IPCPSH Interrupt Enable to PSH CPU

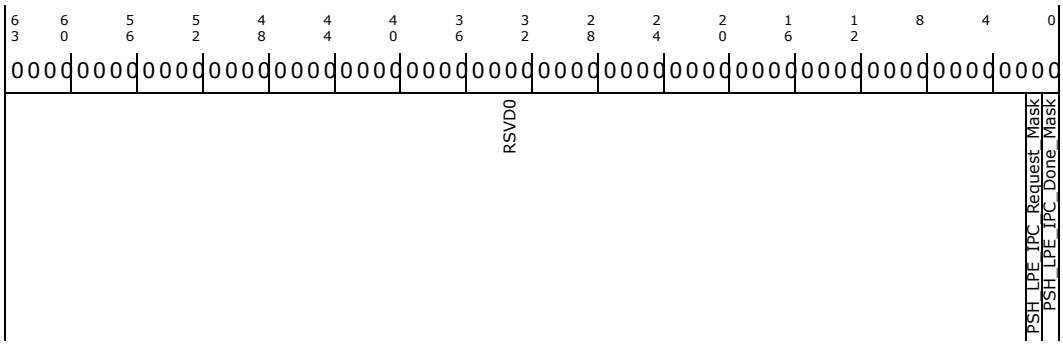
8.12.22 reg_IMRLPEPSH_type (IMRLPEPSH)—Offset A8h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + A8h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW	**PSH_LPE_IPC_Request_Mask:** IPCPSH interrupt Enable to LPE
0	0x0 RW	**PSH_LPE_IPC_Done_Mask:** IPCLPEPSH interrupt Enable to LPE

8.12.23 reg_IPCPSH_type (IPCPSH)—Offset B0h

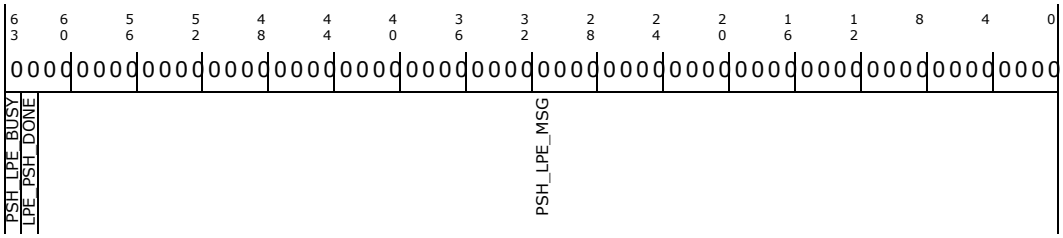
The Inter-process Status and Message register for PSH contains a message sent from the PSH CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCPSH is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPEPSH. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The PSH CPU must not attempt to write into IPCIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + B0h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**PSH_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message
62	0x0 RW	**LPE_PSH_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention
61:0	0x0 RW	**PSH_LPE_MSG:** PSH to LPE Message

8.12.24 reg_IPCLPEPSH_type (IPCLPEPSH)—Offset B8h

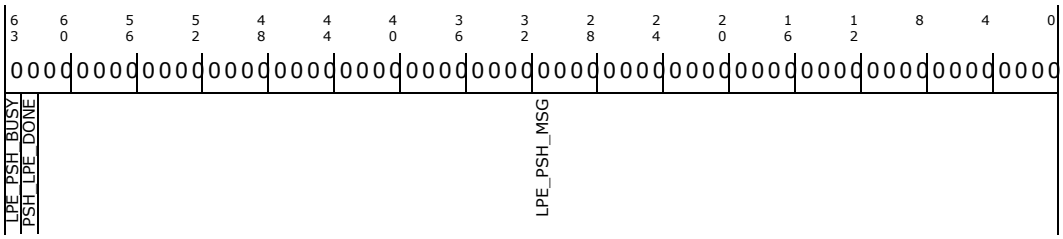
Inter-process Status and Message register for LPE contains a message sent from LPE to PSH. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When PSH reads the message code from the register, and writes back with the bit 63 cleared. When the PSH CPU processes the message sent by LPE, it may set bit 62 in IPCLPEPSH to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + B8h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**LPE_PSH_BUSY:** Busy. When this bit is cleared, the PSH CPU is Ready to accept a new message
62	0x0 RW	**PSH_LPE_DONE:** Done. When the bit is set, the PSH CPU completed operation and requests attention from LPE
61:0	0x0 RW	**LPE_PSH_MSG:** LPE to PSH CPU Message

8.12.25 reg_EXT_TIMER_CNTL_type (EXT_TIMER_CNTL)—Offset C0h

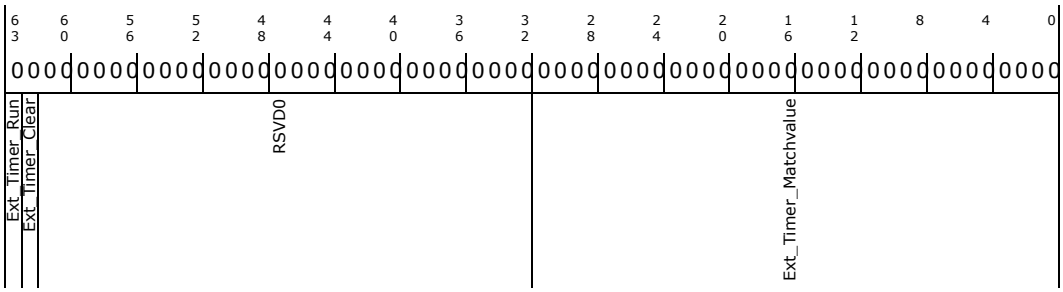
External Timer Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + C0h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**Ext_Timer_Run:** Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer.
62	0x0 RW/S	**Ext_Timer_Clear:** Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits
61:32	0x0 RO	**RSVD0:** Reserved
31:0	0x0 RW	**Ext_Timer_Matchvalue:** The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue.

8.12.26 reg_EXT_TIMER_STAT_type (EXT_TIMER_STAT)—Offset C8h

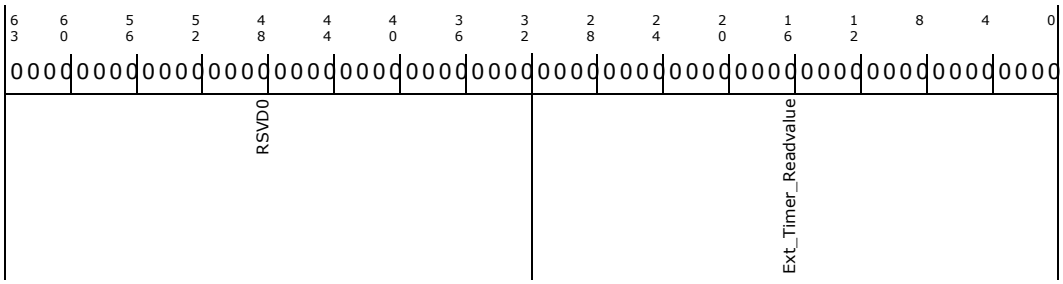
External Timer Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + C8h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:32	0x0 RO	**RSVD0:** Reserved
31:0	0x0 RO	**Ext_Timer_Readvalue:** Shows the current count value of the timer

8.12.27 reg_S0ix_TIMER_CNTL_type (S0ix_TIMER_CNTL)—Offset D0h

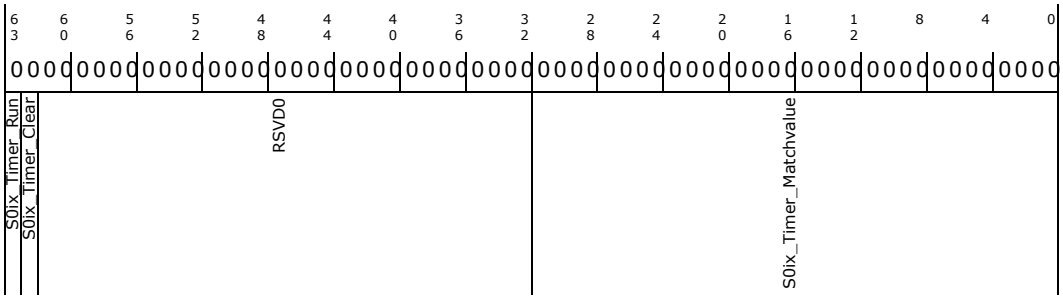
External Timer Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + D0h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**S0ix_Timer_Run:** Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer.
62	0x0 RW/S	**S0ix_Timer_Clear:** Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits
61:32	0x0 RO	**RSVD0:** Reserved
31:0	0x0 RW	**S0ix_Timer_Matchvalue:** The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue.

8.12.28 reg_S0ix_TIMER_STAT_type (S0ix_TIMER_STAT)—Offset D8h

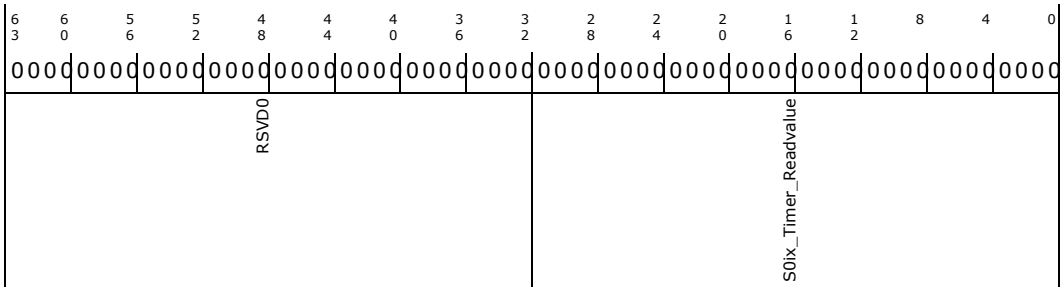
External Timer Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + D8h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:32	0x0 RO	**RSVD0:** Reserved
31:0	0x0 RO	**S0ix_Timer_Readvalue:** Shows the current count value of the timer

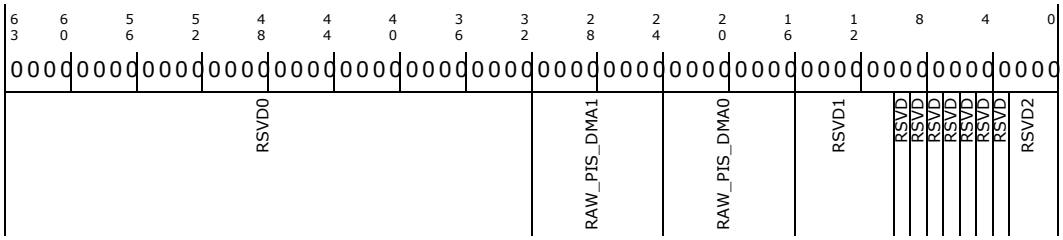
8.12.29 reg_RAW_PISR_type (XT_RAW_PISR)—Offset E0h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [lpe_bridge.BAR + 140000h] + E0h

Default: 0000000000000000h



Bit Range	Default & Access	Field Name (ID): Description
63:32	0x0 RO	**RSVD0:** Reserved

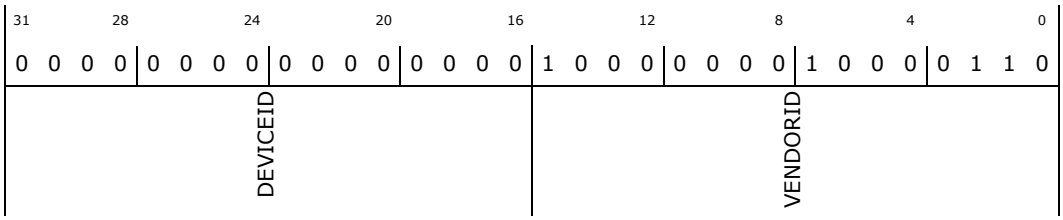
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 0h

Default: 00008086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**DEVICEID:** Device ID identifies the particular AHB/APB device. This is tied to a strap at the top level. Because of tool issues, the HTML files show this field as 0, but the following are the POR values for SoC: LPIO1 DMA: 0x2286 LPIO1 PWM1: 0x2288 LPIO1 PWM2: 0x2289 LPIO1 HSUART1: 0x228A LPIO1 HSUART2: 0x228C LPIO1 SPI1: 0x228E LPIO1 SPI2: 0x2290 LPIO1 SPI3: 0x22AC LPIO2 DMA: 0x22C0 LPIO2 I2C1: 0x22C1 LPIO2 I2C2: 0x22C2 LPIO2 I2C3: 0x22C3 LPIO2 I2C4: 0x22C4 LPIO2 I2C5: 0x22C5 LPIO2 I2C6: 0x22C6 LPIO2 I2C7: 0x22C7 For the final word on this, please see Ray Ng's SoC RevID and DevID HAS on Infofactory: https://ifcollaborate.intel.com/IFC/getdoc.aspx?docbase=InfoFactoryKBandchronid=09005ffd80e84b43andver=CURRENTandqepop=false
15:0	0x8086 RO	**VENDORID:** Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap the top level.

9.1.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

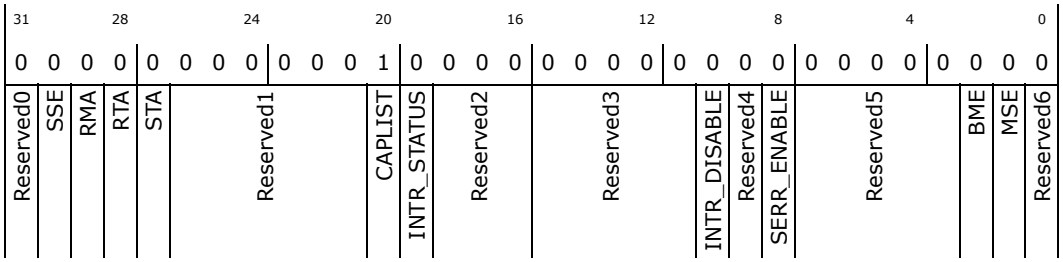
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved0:** Reserved
30	0x0 RW/1C	**SSE:** This bit is set when a device sends an DO_SERR message, and the SERR# Enable bit in the Command register is 1
29	0x0 RW/1C	**RMA:** Received Master Abort: If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a 1. to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric PortReceived Master Abort: If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a 1. to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0x0 RW/1C	**RTA:** Received Target Abort: If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1.1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27	0x0 RW/1C	**STA:** The Bridge sets this bit whenever it responds to a transaction with CA abort. If the SERR# Enable bit is set, the Bridge sets the Signaled System Error bit and sends an DO_SERR message on the IOSF Sideband.
26:21	0x0 RO	**Reserved1:** Reserved
20	0x1 RO	**CAPLIST:** Capabilities List: Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0
19	0x0 RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device.s/function.s INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0x0 RO	**Reserved2:** Reserved
15:11	0x0 RO	**Reserved3:** Reserved
10	0x0 RW	**INTR_DISABLE:** Interrupt Disable: Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt .i.e Bridge does not send Interrupt Assert message through the IOSF SideBand Channel.. Reset value of this bit is 0.
9	0x0 RO	**Reserved4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 RW	**SERR_ENABLE:** SERR# Enable: If both SERR# Enable and the Unsupported Request Reporting Enable (URRE) register are 1., the agent sets the Signaled System Error bit in the PCI Status Register and sends an ERR_NONFATAL message on the IOSF sideband interface.
7:3	0x0 RO	**Reserved5:** Reserved
2	0x0 RW	**BME:** Bus Master Enable: If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0x0 RW	**MSE:** Memory Space Enable: This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled. Reset value of this bit is 0.
0	0x0 RO	**Reserved6:** Reserved

9.1.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

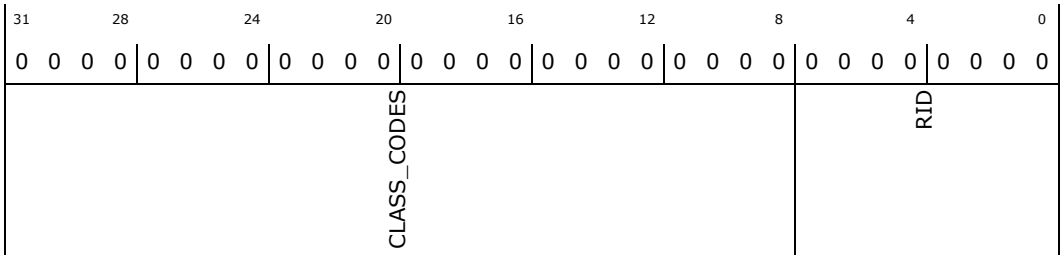
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	0x0 RO	**RID:** Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

9.1.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

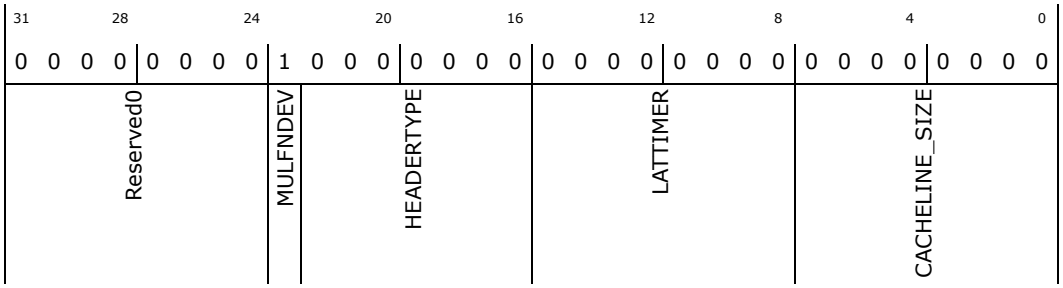
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + Ch

Default: 00800000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved0:** Reserved
23	0x1 RO	**MULFNDEV:** Multi Function Device: This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. Value of 1 indicates multifunction device value of 0 indicates single function device
22:16	0x0 RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header.
15:8	0x0 RO	**LATTIMER:** Latency Timer: Doesn.t apply to PCI Express. Hardwired to 00h.
7:0	0x0 RW	**CACHELINE_SIZE:** Cache Line Size: Doesn.t apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

9.1.5 BAR -Base Address Register (BAR)—Offset 10h

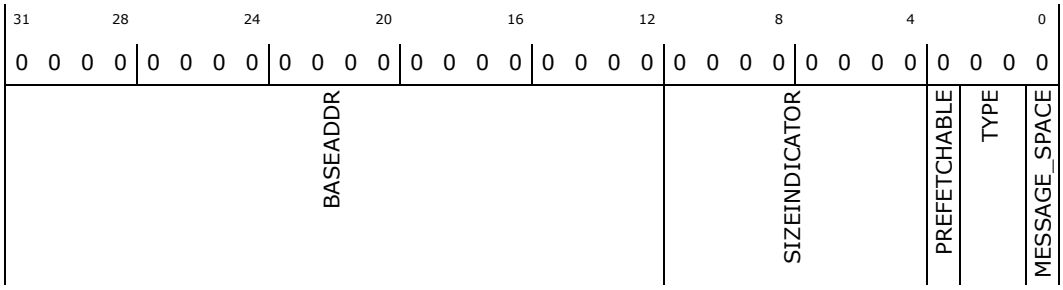
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR:** Base Address: Base address of the AHB device memory space. Taken from Strap values as 1's. Please note that for DMA this field goes from [31:14], or 16kbyte, and the SIZEINDICATOR field goes from [13:4].
11:4	0x0 RO	**SIZEINDICATOR:** Size Indicator Read Only: Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K
3	0x0 RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0x0 RO	**TYPE:** Type: 00 Indicates BAR lies in 32 bit address range.
0	0x0 RO	**MESSAGE_SPACE:** Memory Space Indicator: 0. Indicates this BAR is present in the memory space.

9.1.6 BAR1 -Base Address Register1 (BAR1)—Offset 14h

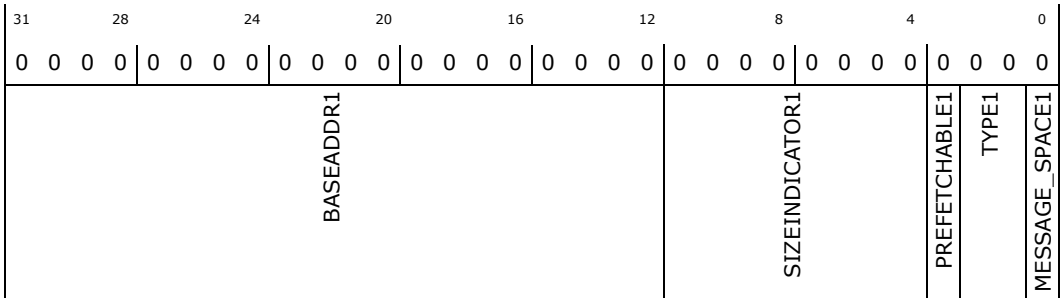
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**BASEADDR1:** Base Address Register1: BAR1 of the LPIO device.

Bit Range	Default & Access	Field Name (ID): Description
11:4	0x0 RO	**SIZEINDICATOR1:** Always will be zero as minimum size is 4K
3	0x0 RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not
2:1	0x0 RO	**TYPE1:** Type: 00 Indicates BAR lies in 32 bit address range.
0	0x0 RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0. Indicates this BAR is present in the memory space.

9.1.7 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

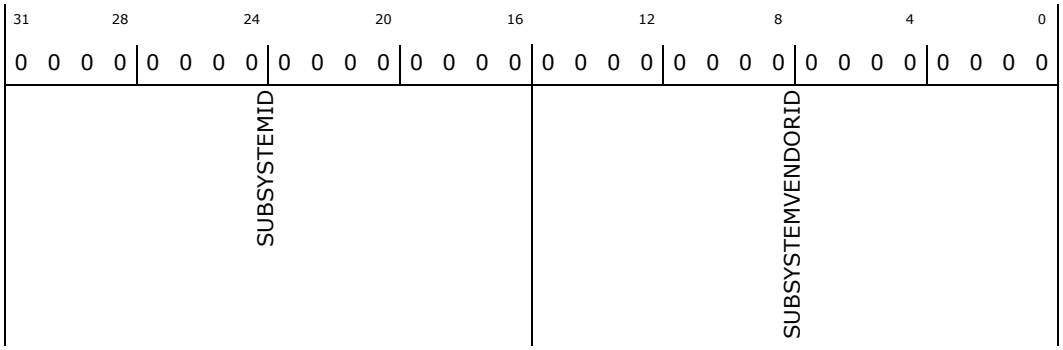
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**SUBSYSTEMID:** Subsystem ID: This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0x0 RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register

9.1.8 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

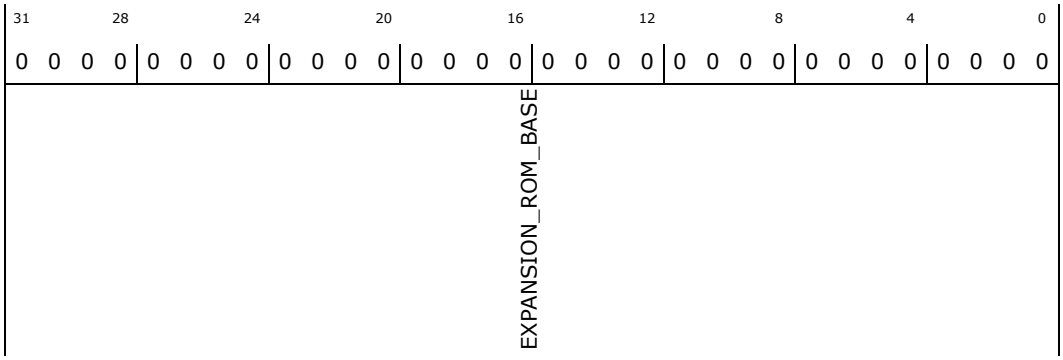
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**EXPANSION_ROM_BASE:** A value of all zeros indicates no support for expansion ROM.

9.1.9 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

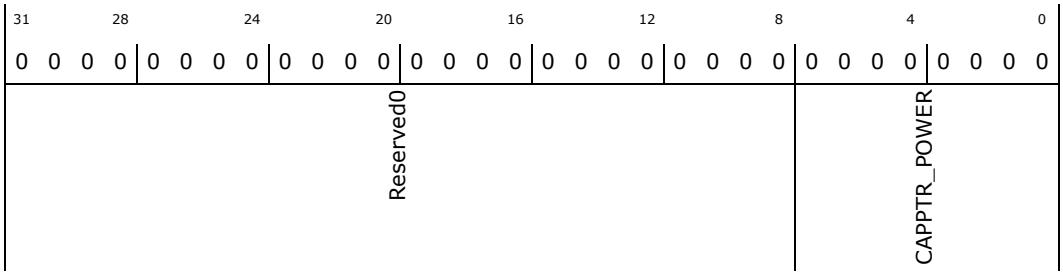
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 34h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved0:** Reserved
7:0	0x0 RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

9.1.10 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

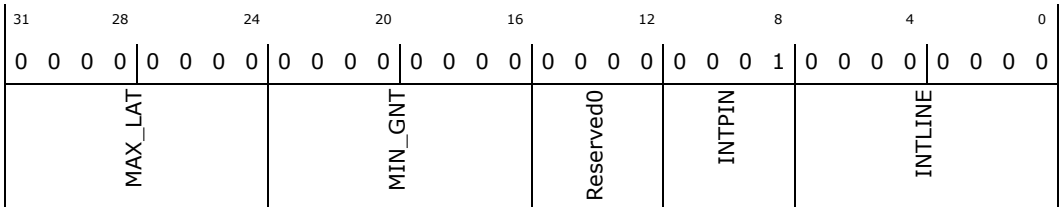
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**MAX_LAT:** Max_Lat: Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0x0 RO	**MIN_GNT:** Min_Gnt: Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0x0 RO	**Reserved0:** Reserved
11:8	0x1 RO	**INTPIN:** Interrupt Pin: Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0x0 RW	**INTLINE:** Interrupt Line: Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

9.1.11 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

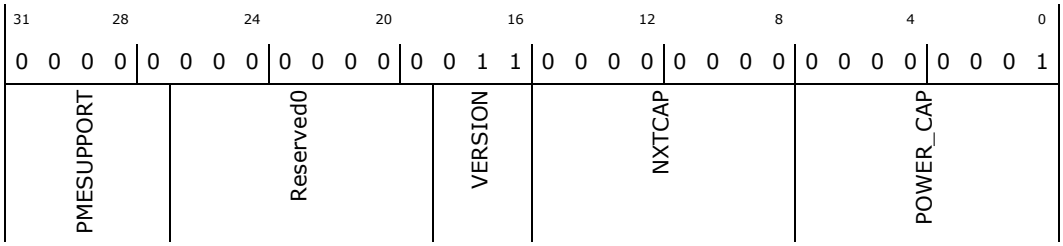
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 80h

Default: 00030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PMESUPPORT:** PME_Support - This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	0x0 RO	**Reserved0:** Reserved
18:16	0x3 RO	**VERSION:** Version: Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0x0 RO	**NXTCAP:** Next Capability: Points to the next capability structure. This points to NULL.
7:0	0x1 RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability.

9.1.12 PMECTRLSTATUS - PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

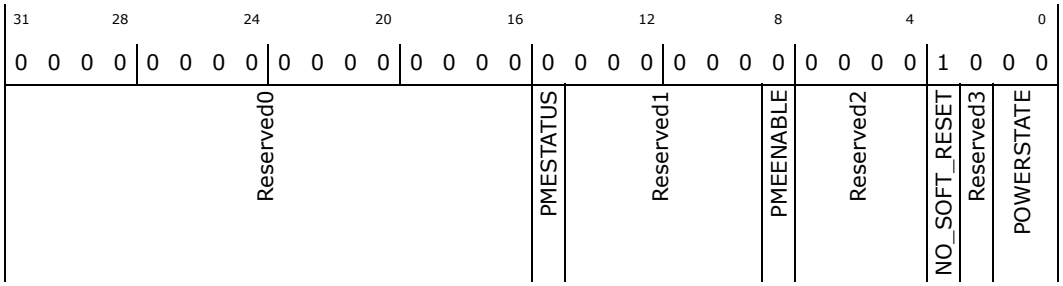
PMECTRLSTATUS - PME Control and Status Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved0:** Reserved
15	0x0 RW/1C	**PMESTATUS:** PME Status: 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register)
14:9	0x0 RO	**Reserved1:** Reserved
8	0x0 RW	**PMEENABLE:** PME Enable: A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0x0 RO	**Reserved2:** Reserved
3	0x1 RO	**NO_SOFT_RESET:** No_Soft_Reset: This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0x0 RO	**Reserved3:** Reserved
1:0	0x0 RW	**POWERSTATE:** Power State : This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

9.1.13 Manufacturers ID (MANID)—Offset F8h

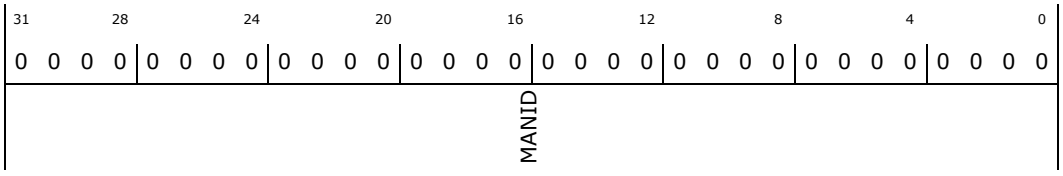
Manufacturers ID

Access Method

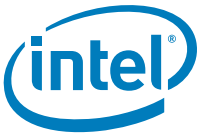
Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:30, F:0] + F8h

Default: 00000000h



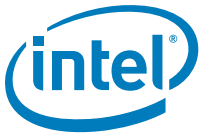
Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**MANID:** Manufacturer ID: This register is brought out as straps to the top level.



9.2 SIO DMA 1 Memory Mapped I/O Registers for I2C

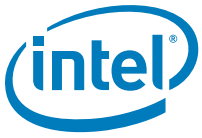
Table 65. Summary of SIO DMA 1 Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Source Address Register for Channel 0 - LOW (SAR0_LO)—Offset 0h" on page 3915	00000000h
4–7h	4	"Source Address Register for Channel 0 - HIGH (SAR0_HI)—Offset 4h" on page 3915	00000000h
8–Bh	4	"Destination Address Register for Channel 0 - LOW (DAR0_LO)—Offset 8h" on page 3916	00000000h
C–Fh	4	"Destination Address Register for Channel 0 - HIGH (DAR0_HI)—Offset Ch" on page 3916	00000000h
10–13h	4	"Linked List Pointer Register for Channel 0 - LOW (LLP0_LO)—Offset 10h" on page 3917	00000000h
14–17h	4	"Linked List Pointer Register for Channel 0 - HIGH (LLP0_HI)—Offset 14h" on page 3917	00000000h
18–1Bh	4	"Control Register for Channel 0 - LOW (CTL0_LO)—Offset 18h" on page 3918	00304801h
1C–1Fh	4	"Control Register for Channel 0 - HIGH (CTL0_HI)—Offset 1Ch" on page 3919	00000002h
40–43h	4	"Configuration register for Channel 0 - LOW (CFG0_LO)—Offset 40h" on page 3919	00000E00h
44–47h	4	"Configuration register for Channel 0 - HIGH (CFG0_HI)—Offset 44h" on page 3921	00000004h
48–4Bh	4	"Source Gather Register for Channel 0 - LOW (SGR0_LO)—Offset 48h" on page 3922	00000000h
4C–4Fh	4	"Source Gather Register for Channel 0 - HIGH (SGR0_HI)—Offset 4Ch" on page 3922	00000000h
50–53h	4	"Destination Scatter Register for Channel 0 - LOW (DSR0_LO)—Offset 50h" on page 3923	00000000h
54–57h	4	"Dest scatter Register for Channel 0 - HIGH (DSR0_HI)—Offset 54h" on page 3923	00000000h
58–5Bh	4	"Source Address Register for Channel 1 - LOW (SAR1_LO)—Offset 58h" on page 3924	00000000h
5C–5Fh	4	"Source Address Register for Channel 1 - HIGH (SAR1_HI)—Offset 5Ch" on page 3924	00000000h
60–63h	4	"Destination Address Register for Channel 1 - LOW (DAR1_LO)—Offset 60h" on page 3925	00000000h
64–67h	4	"Destination Address Register for Channel 1 - HIGH (DAR1_HI)—Offset 64h" on page 3925	00000000h
68–6Bh	4	"Linked List Pointer Register for Channel 1 - LOW (LLP1_LO)—Offset 68h" on page 3926	00000000h
6C–6Fh	4	"Linked List Pointer Register for Channel 1 - HIGH (LLP1_HI)—Offset 6Ch" on page 3926	00000000h



Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
70–73h	4	"Control Register for Channel 1 - LOW (CTL1_LO)—Offset 70h" on page 3927	00304801h
74–77h	4	"Control Register for Channel 1 - HIGH (CTL1_HI)—Offset 74h" on page 3928	00000002h
98–9Bh	4	"Configuration register for Channel 1 - LOW (CFG1_LO)—Offset 98h" on page 3929	00000E20h
9C–9Fh	4	"Configuration register for Channel 1 - HIGH (CFG1_HI)—Offset 9Ch" on page 3930	00000004h
A0–A3h	4	"Source Gather Register for Channel 1 - LOW (SGR1_LO)—Offset A0h" on page 3931	00000000h
A4–A7h	4	"Source Gather Register for Channel 1 - HIGH (SGR1_HI)—Offset A4h" on page 3932	00000000h
A8–ABh	4	"Destination Scatter Register for Channel 1 - LOW (DSR1_LO)—Offset A8h" on page 3932	00000000h
AC–AFh	4	"Dest scatter Register for Channel 1 - HIGH (DSR1_HI)—Offset ACh" on page 3933	00000000h
B0–B3h	4	"Source Address Register for Channel 2 - LOW (SAR2_LO)—Offset B0h" on page 3933	00000000h
B4–B7h	4	"Source Address Register for Channel 2 - HIGH (SAR2_HI)—Offset B4h" on page 3934	00000000h
B8–BBh	4	"Destination Address Register for Channel 2 - LOW (DAR2_LO)—Offset B8h" on page 3934	00000000h
BC–BFh	4	"Destination Address Register for Channel 2 - HIGH (DAR2_HI)—Offset BCh" on page 3935	00000000h
C0–C3h	4	"Linked List Pointer Register for Channel 2 - LOW (LLP2_LO)—Offset C0h" on page 3935	00000000h
C4–C7h	4	"Linked List Pointer Register for Channel 2 - HIGH (LLP2_HI)—Offset C4h" on page 3936	00000000h
C8–CBh	4	"Control Register for Channel 2 - LOW (CTL2_LO)—Offset C8h" on page 3936	00304801h
CC–CFh	4	"Control Register for Channel 2 - HIGH (CTL2_HI)—Offset CCh" on page 3938	00000002h
F0–F3h	4	"Configuration register for Channel 2 - LOW (CFG2_LO)—Offset F0h" on page 3938	00000E40h
F4–F7h	4	"Configuration register for Channel 2 - HIGH (CFG2_HI)—Offset F4h" on page 3939	00000004h
F8–FBh	4	"Source Gather Register for Channel 2 - LOW (SGR2_LO)—Offset F8h" on page 3940	00000000h
FC–FFh	4	"Source Gather Register for Channel 2 - HIGH (SGR2_HI)—Offset FCh" on page 3941	00000000h
100–103h	4	"Destination Scatter Register for Channel 2 - LOW (DSR2_LO)—Offset 100h" on page 3941	00000000h
104–107h	4	"Dest scatter Register for Channel 2 - HIGH (DSR2_HI)—Offset 104h" on page 3942	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
108–10Bh	4	"Source Address Register for Channel 3 - LOW (SAR3_LO)—Offset 108h" on page 3942	00000000h
10C–10Fh	4	"Source Address Register for Channel 3 - HIGH (SAR3_HI)—Offset 10Ch" on page 3943	00000000h
110–113h	4	"Destination Address Register for Channel 3 - LOW (DAR3_LO)—Offset 110h" on page 3943	00000000h
114–117h	4	"Destination Address Register for Channel 3 - HIGH (DAR3_HI)—Offset 114h" on page 3944	00000000h
118–11Bh	4	"Linked List Pointer Register for Channel 3 - LOW (LLP3_LO)—Offset 118h" on page 3944	00000000h
11C–11Fh	4	"Linked List Pointer Register for Channel 3 - HIGH (LLP3_HI)—Offset 11Ch" on page 3945	00000000h
120–123h	4	"Control Register for Channel 3 - LOW (CTL3_LO)—Offset 120h" on page 3945	00304801h
124–127h	4	"Control Register for Channel 3 - HIGH (CTL3_HI)—Offset 124h" on page 3947	00000002h
148–14Bh	4	"Configuration register for Channel 3 - LOW (CFG3_LO)—Offset 148h" on page 3947	00000E60h
14C–14Fh	4	"Configuration register for Channel 3 - HIGH (CFG3_HI)—Offset 14Ch" on page 3949	00000004h
150–153h	4	"Source Gather Register for Channel 3 - LOW (SGR3_LO)—Offset 150h" on page 3950	00000000h
154–157h	4	"Source Gather Register for Channel 3 - HIGH (SGR3_HI)—Offset 154h" on page 3950	00000000h
158–15Bh	4	"Destination Scatter Register for Channel 3 - LOW (DSR3_LO)—Offset 158h" on page 3951	00000000h
15C–15Fh	4	"Dest scatter Register for Channel 3 - HIGH (DSR3_HI)—Offset 15Ch" on page 3951	00000000h
160–163h	4	"Source Address Register for Channel 4 - LOW (SAR4_LO)—Offset 160h" on page 3952	00000000h
164–167h	4	"Source Address Register for Channel 4 - HIGH (SAR4_HI)—Offset 164h" on page 3952	00000000h
168–16Bh	4	"Destination Address Register for Channel 4 - LOW (DAR4_LO)—Offset 168h" on page 3953	00000000h
16C–16Fh	4	"Destination Address Register for Channel 4 - HIGH (DAR4_HI)—Offset 16Ch" on page 3953	00000000h
170–173h	4	"Linked List Pointer Register for Channel 4 - LOW (LLP4_LO)—Offset 170h" on page 3954	00000000h
174–177h	4	"Linked List Pointer Register for Channel 4 - HIGH (LLP4_HI)—Offset 174h" on page 3954	00000000h
178–17Bh	4	"Control Register for Channel 4 - LOW (CTL4_LO)—Offset 178h" on page 3955	00304801h
17C–17Fh	4	"Control Register for Channel 4 - HIGH (CTL4_HI)—Offset 17Ch" on page 3956	00000002h



Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1A0–1A3h	4	"Configuration register for Channel 4 - LOW (CFG4_LO)—Offset 1A0h" on page 3957	00000E80h
1A4–1A7h	4	"Configuration register for Channel 4 - HIGH (CFG4_HI)—Offset 1A4h" on page 3958	00000004h

9.2.1 Source Address Register for Channel 0 - LOW (SAR0_LO)—Offset 0h

Source Address Register for Channel 0

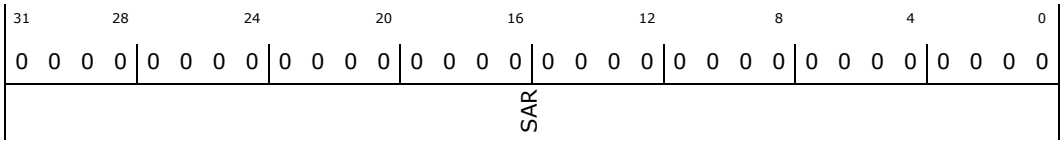
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.2 Source Address Register for Channel 0 - HIGH (SAR0_HI)—Offset 4h

Source Address Register for Channel 0

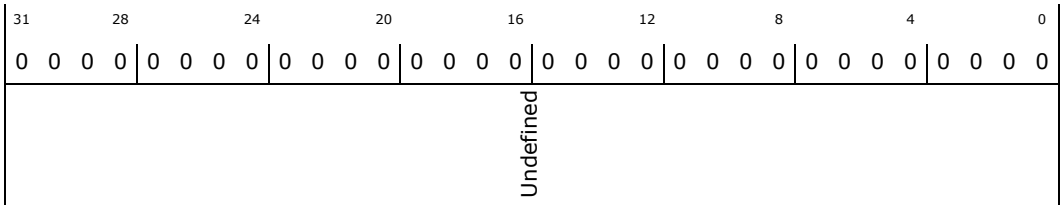
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.3 Destination Address Register for Channel 0 - LOW (DAR0_LO)—Offset 8h

Destination Address Register for Channel 0

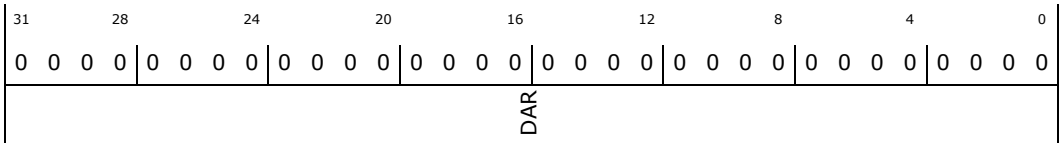
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.4 Destination Address Register for Channel 0 - HIGH (DAR0_HI)—Offset Ch

Destination Address Register for Channel 0

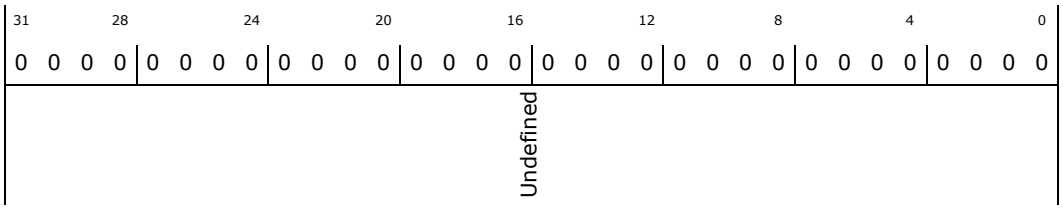
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.5 Linked List Pointer Register for Channel 0 - LOW (LLP0_LO)—Offset 10h

Linked List Pointer Register for Channel 0

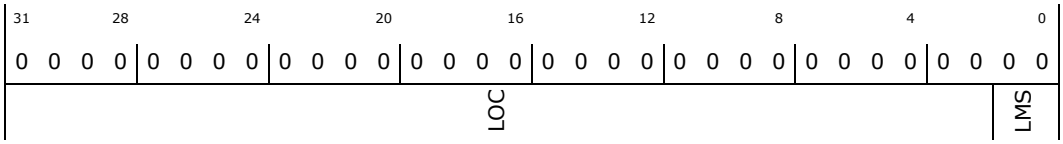
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.6 Linked List Pointer Register for Channel 0 - HIGH (LLP0_HI)—Offset 14h

Linked List Pointer Register for Channel 0

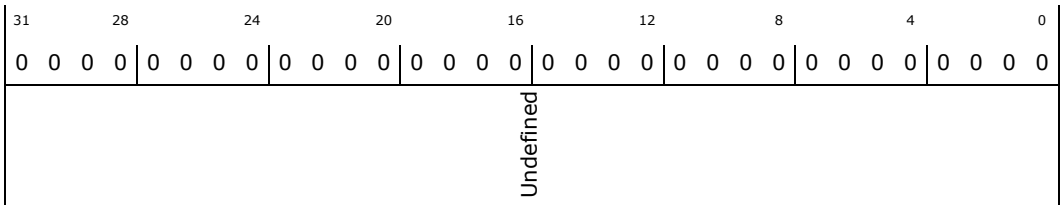
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.7 Control Register for Channel 0 - LOW (CTL0_LO)—Offset 18h

Control Register for Channel 0

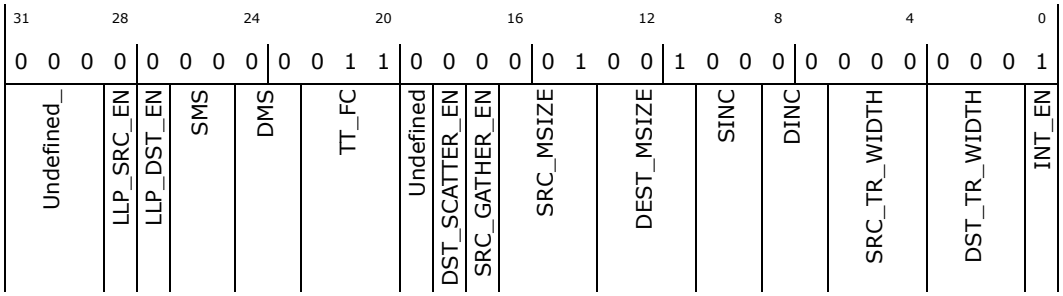
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change

Bit Range	Default & Access	Field Name (ID): Description
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.8 Control Register for Channel 0 - HIGH (CTL0_HI)—Offset 1Ch

Control Register for Channel 0

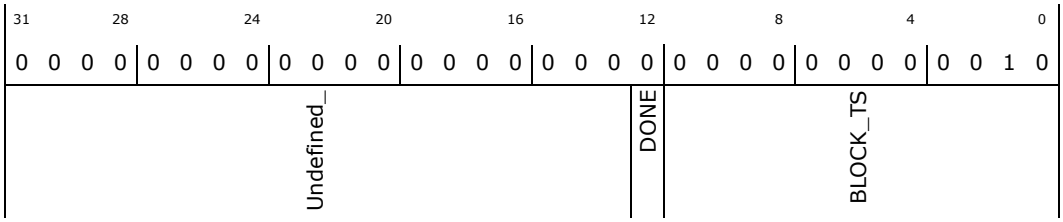
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.9 Configuration register for Channel 0 - LOW (CFG0_LO)—Offset 40h

Configuration register for Channel 0

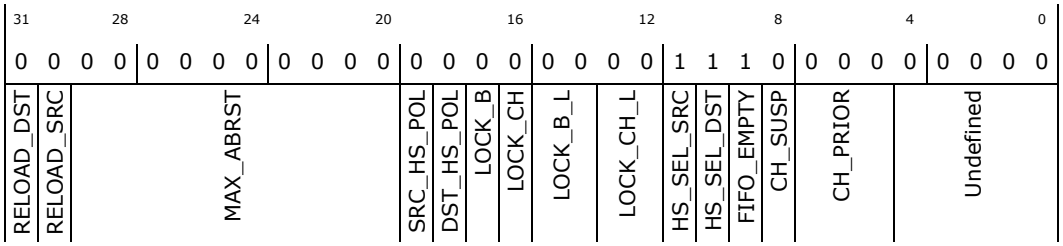
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E00h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking

Bit Range	Default & Access	Field Name (ID): Description
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x0 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.
4:0	0x0 RW	**Undefined:** RESERVED

9.2.10 Configuration register for Channel 0 - HIGH (CFG0_HI)—Offset 44h

Configuration register for Channel 0 _ HIGH

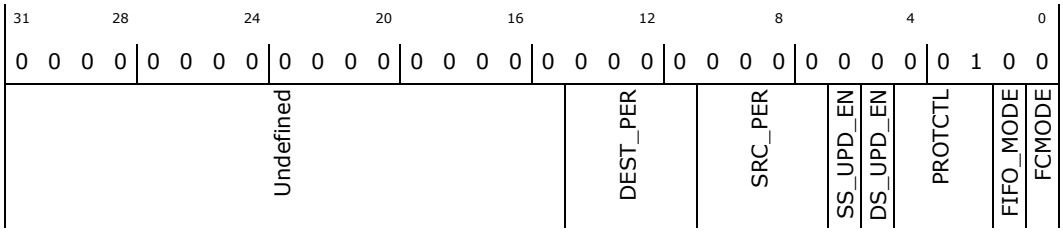
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.

Bit Range	Default & Access	Field Name (ID): Description
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.11 Source Gather Register for Channel 0 - LOW (SGR0_LO)—Offset 48h

Source Gather Register for Channel 0

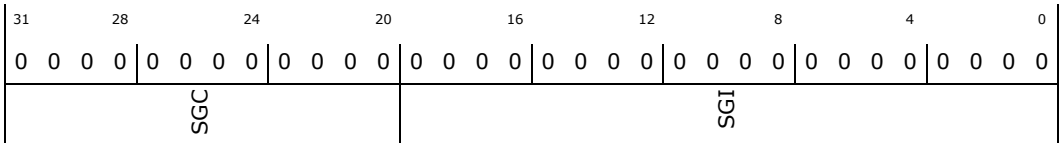
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.12 Source Gather Register for Channel 0 - HIGH (SGR0_HI)—Offset 4Ch

Source Gather Register for Channel 0

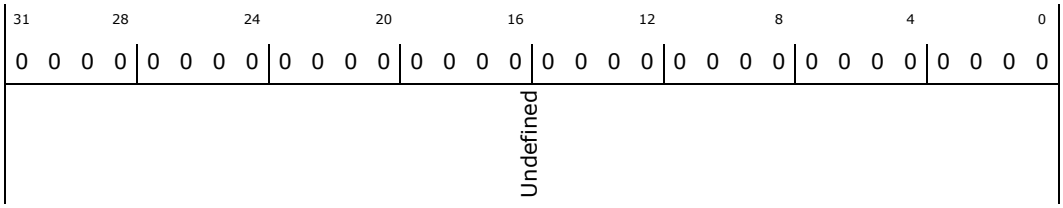
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.13 Destination Scatter Register for Channel 0 - LOW (DSR0_LO)—Offset 50h

Destination Scatter Register for Channel 0

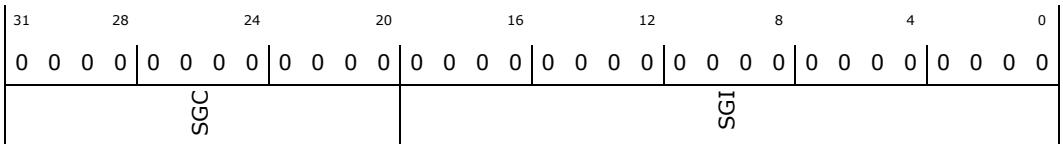
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.14 Dest scatter Register for Channel 0 - HIGH (DSR0_HI)—Offset 54h

Dest scatter Register for Channel 0

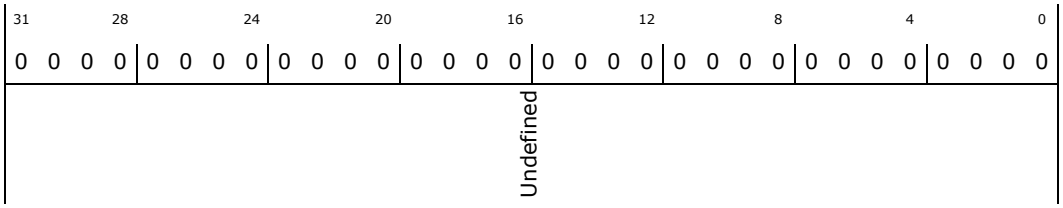
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.15 Source Address Register for Channel 1 - LOW (SAR1_LO)—Offset 58h

Source Address Register for Channel 1

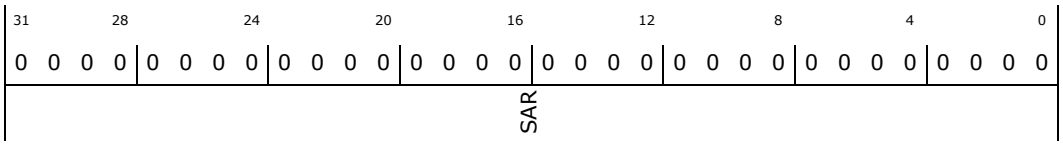
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.16 Source Address Register for Channel 1 - HIGH (SAR1_HI)—Offset 5Ch

Source Address Register for Channel 1

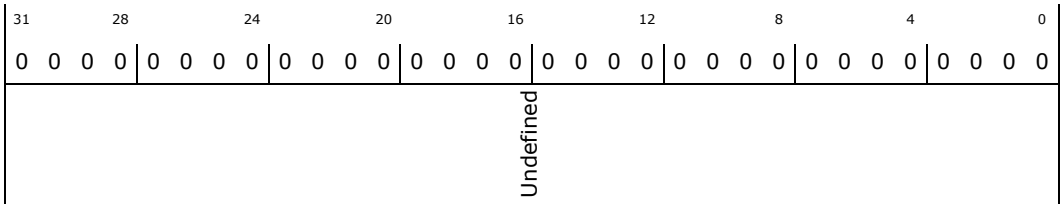
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 5Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.17 Destination Address Register for Channel 1 - LOW (DAR1_LO)—Offset 60h

Destination Address Register for Channel 1

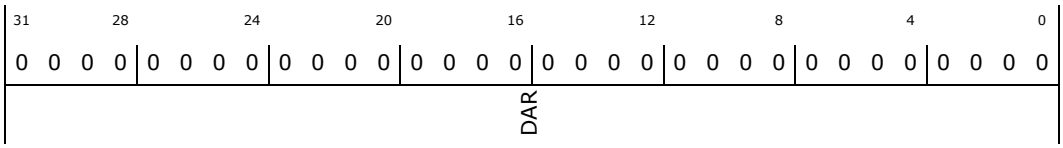
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.18 Destination Address Register for Channel 1 - HIGH (DAR1_HI)—Offset 64h

Destination Address Register for Channel 1

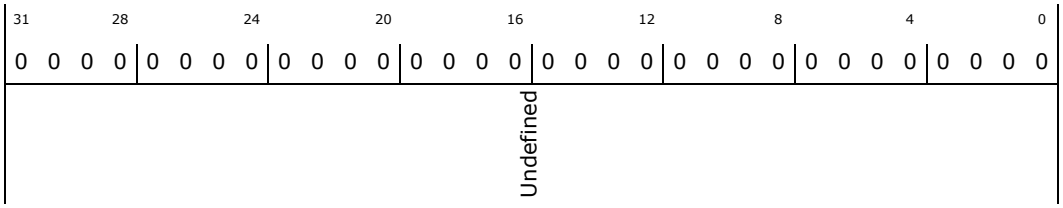
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 64h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.19 Linked List Pointer Register for Channel 1 - LOW (LLP1_LO)—Offset 68h

Linked List Pointer Register for Channel 1

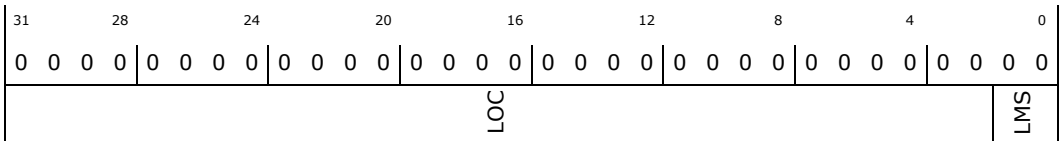
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.20 Linked List Pointer Register for Channel 1 - HIGH (LLP1_HI)—Offset 6Ch

Linked List Pointer Register for Channel 1

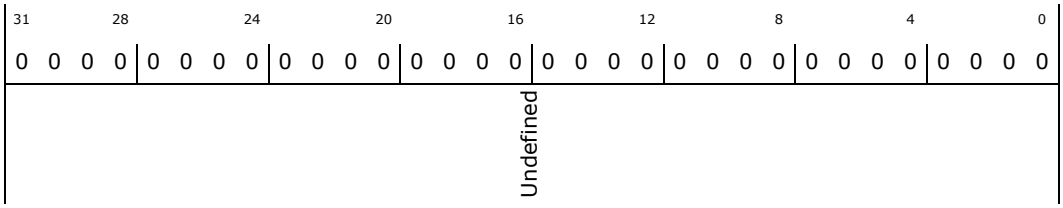
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.21 Control Register for Channel 1 - LOW (CTL1_LO)—Offset 70h

Control Register for Channel 1

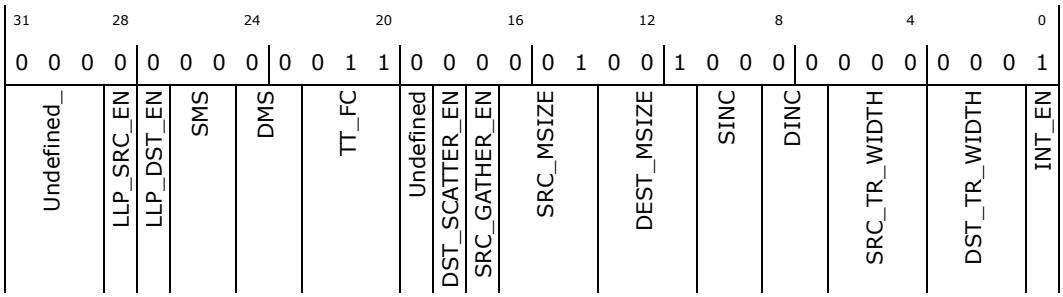
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.

Bit Range	Default & Access	Field Name (ID): Description
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.22 Control Register for Channel 1 - HIGH (CTL1_HI)—Offset 74h

Control Register for Channel 1

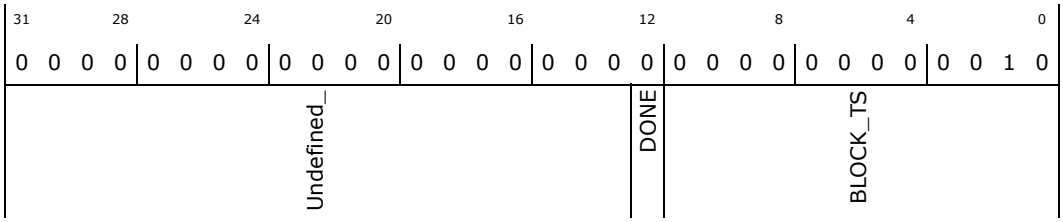
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.23 Configuration register for Channel 1 - LOW (CFG1_LO)—Offset 98h

Configuration register for Channel 1

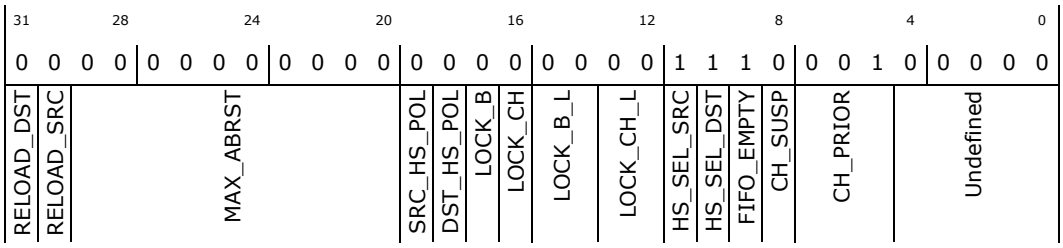
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

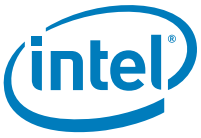
Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E20h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.



Bit Range	Default & Access	Field Name (ID): Description
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x1 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.
4:0	0x0 RW	**Undefined:** RESERVED

9.2.24 Configuration register for Channel 1 - HIGH (CFG1_HI)—Offset 9Ch

Configuration register for Channel 1 _ HIGH

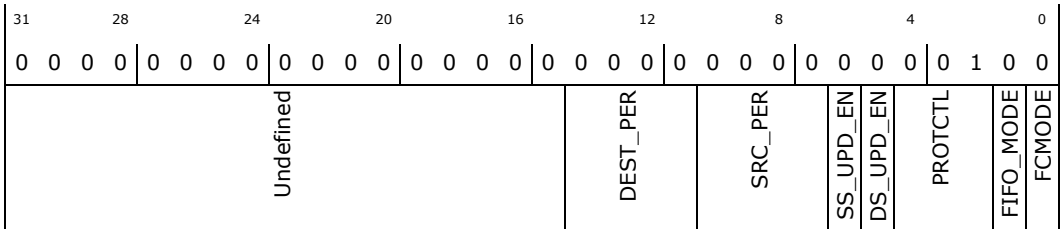
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.25 Source Gather Register for Channel 1 - LOW (SGR1_LO)—Offset A0h

Source Gather Register for Channel 1

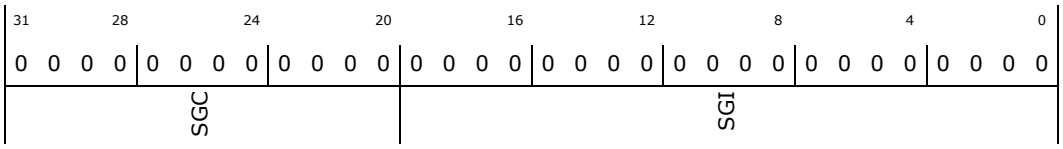
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + A0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.26 Source Gather Register for Channel 1 - HIGH (SGR1_HI)—Offset A4h

Source Gather Register for Channel 1

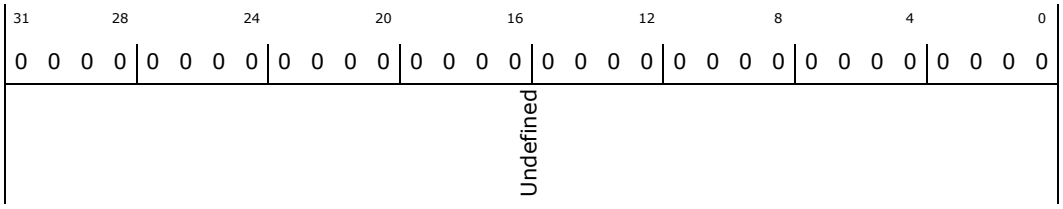
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + A4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.27 Destination Scatter Register for Channel 1 - LOW (DSR1_LO)—Offset A8h

Destination Scatter Register for Channel 1

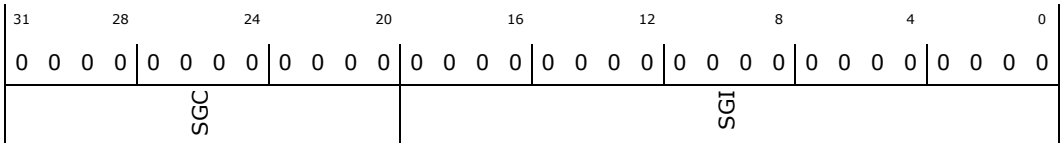
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + A8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.28 Dest scatter Register for Channel 1 - HIGH (DSR1_HI)—Offset ACh

Dest scatter Register for Channel 1

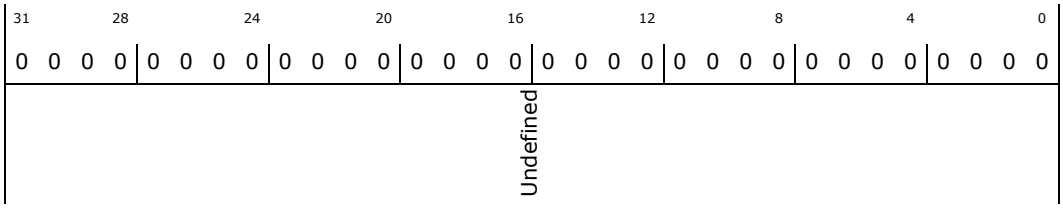
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + ACh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.29 Source Address Register for Channel 2 - LOW (SAR2_LO)—Offset B0h

Source Address Register for Channel 2

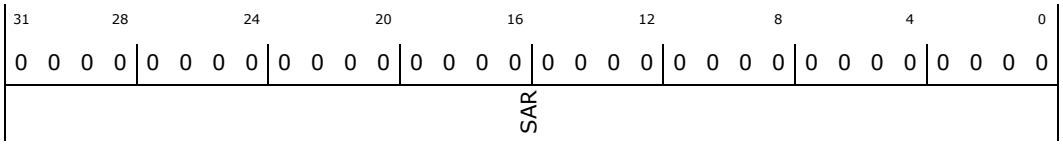
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + B0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.30 Source Address Register for Channel 2 - HIGH (SAR2_HI)—Offset B4h

Source Address Register for Channel 2

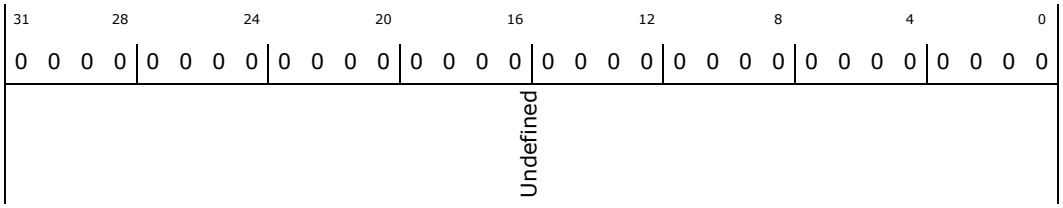
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + B4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.31 Destination Address Register for Channel 2 - LOW (DAR2_LO)—Offset B8h

Destination Address Register for Channel 2

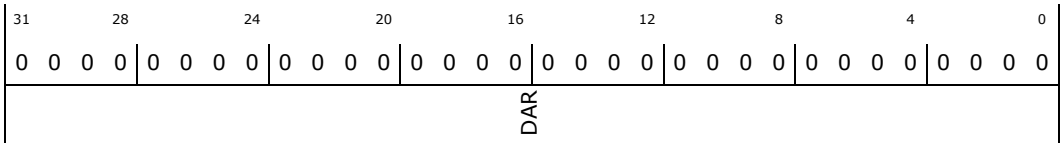
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + B8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.32 Destination Address Register for Channel 2 - HIGH (DAR2_HI)—Offset BCh

Destination Address Register for Channel 2

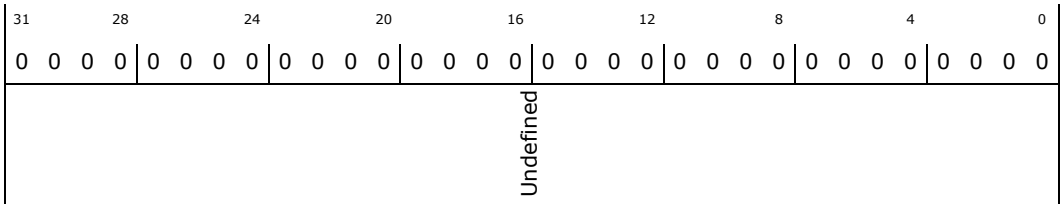
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + BCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.33 Linked List Pointer Register for Channel 2 - LOW (LLP2_LO)—Offset C0h

Linked List Pointer Register for Channel 2

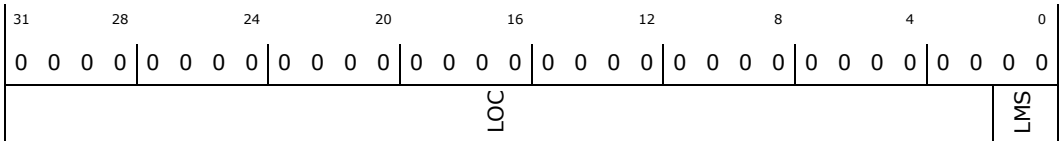
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + C0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.34 Linked List Pointer Register for Channel 2 - HIGH (LLP2_HI)—Offset C4h

Linked List Pointer Register for Channel 2

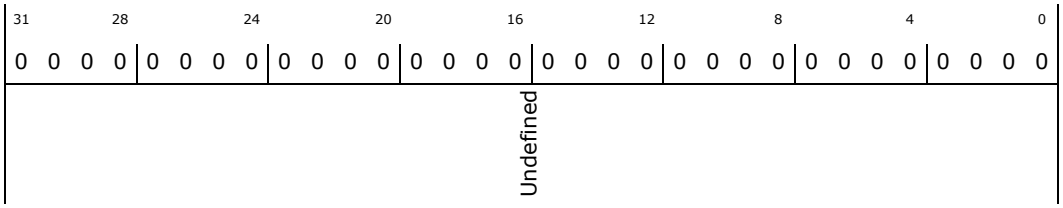
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + C4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.35 Control Register for Channel 2 - LOW (CTL2_LO)—Offset C8h

Control Register for Channel 2

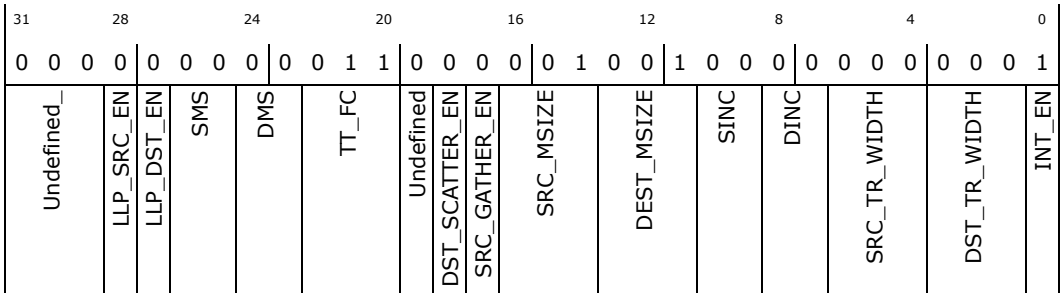
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + C8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.36 Control Register for Channel 2 - HIGH (CTL2_HI)—Offset CCh

Control Register for Channel 2

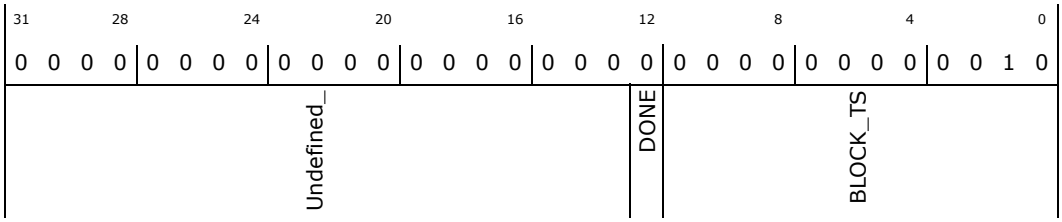
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + CCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.37 Configuration register for Channel 2 - LOW (CFG2_LO)—Offset F0h

Configuration register for Channel 2

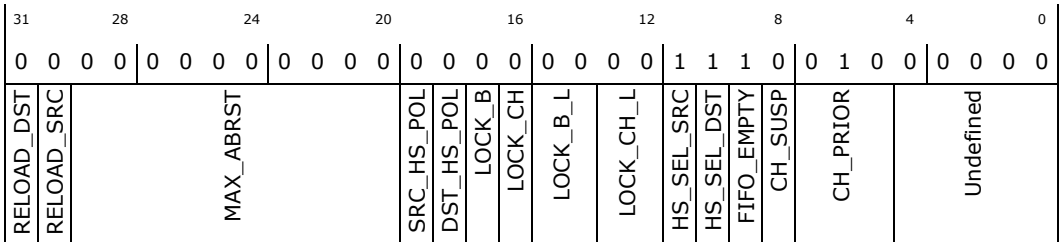
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + F0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E40h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x2 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.
4:0	0x0 RW	**Undefined:** RESERVED

9.2.38 Configuration register for Channel 2 - HIGH (CFG2_HI)—Offset F4h

Configuration register for Channel 2 _ HIGH

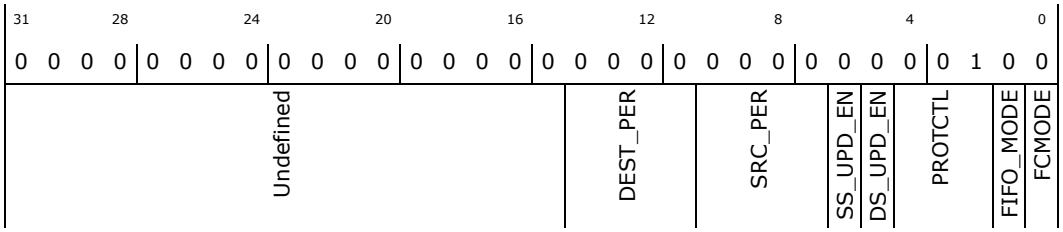
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + F4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.39 Source Gather Register for Channel 2 - LOW (SGR2_LO)—Offset F8h

Source Gather Register for Channel 2

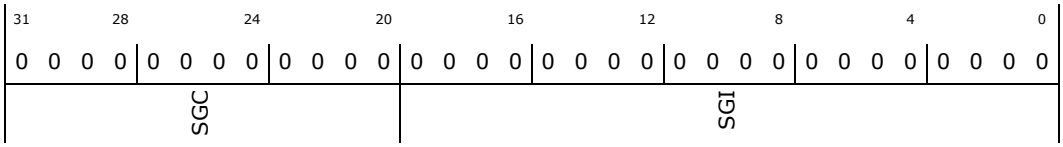
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + F8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.40 Source Gather Register for Channel 2 - HIGH (SGR2_HI)—Offset FCh

Source Gather Register for Channel 2

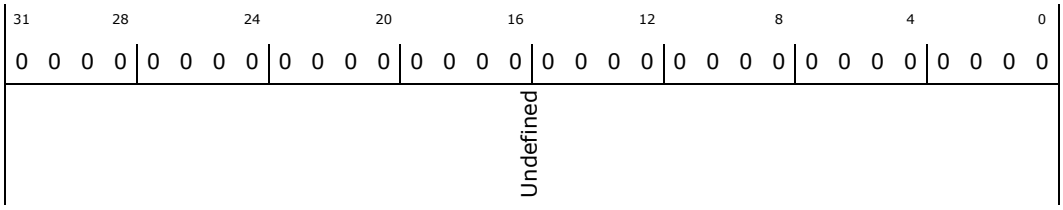
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.41 Destination Scatter Register for Channel 2 - LOW (DSR2_LO)—Offset 100h

Destination Scatter Register for Channel 2

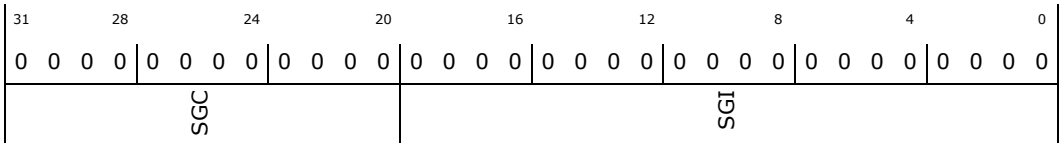
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 100h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.42 Dest scatter Register for Channel 2 - HIGH (DSR2_HI)—Offset 104h

Dest scatter Register for Channel 2

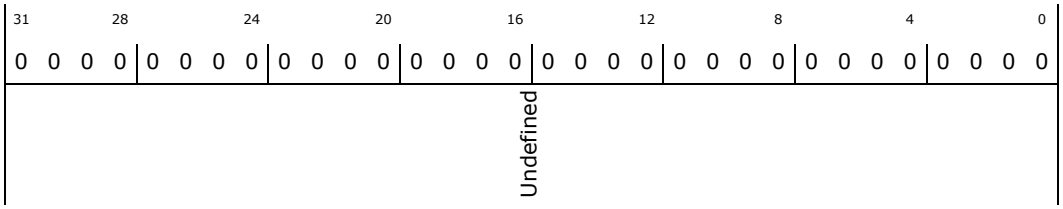
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 104h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.43 Source Address Register for Channel 3 - LOW (SAR3_LO)—Offset 108h

Source Address Register for Channel 3

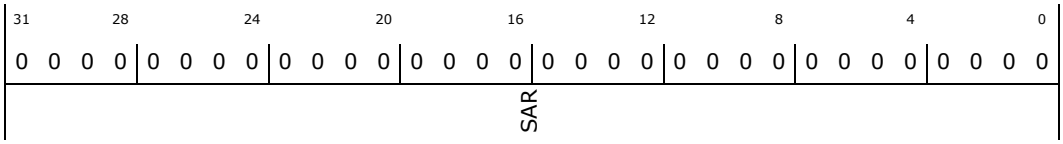
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 108h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.44 Source Address Register for Channel 3 - HIGH (SAR3_HI)—Offset 10Ch

Source Address Register for Channel 3

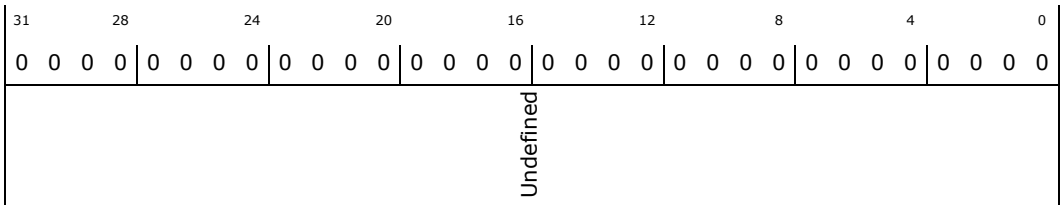
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 10Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.45 Destination Address Register for Channel 3 - LOW (DAR3_LO)—Offset 110h

Destination Address Register for Channel 3

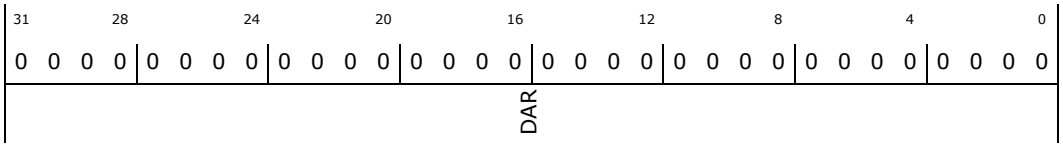
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 110h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.46 Destination Address Register for Channel 3 - HIGH (DAR3_HI)—Offset 114h

Destination Address Register for Channel 3

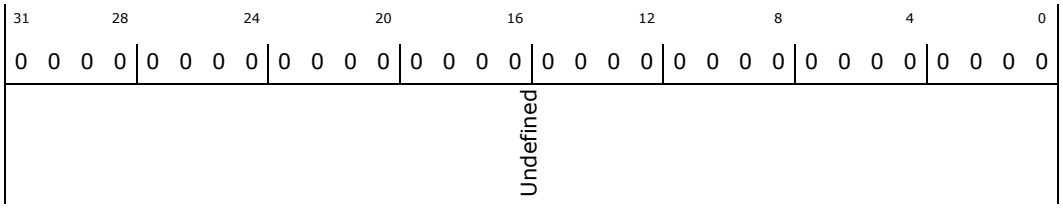
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 114h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.47 Linked List Pointer Register for Channel 3 - LOW (LLP3_LO)—Offset 118h

Linked List Pointer Register for Channel 3

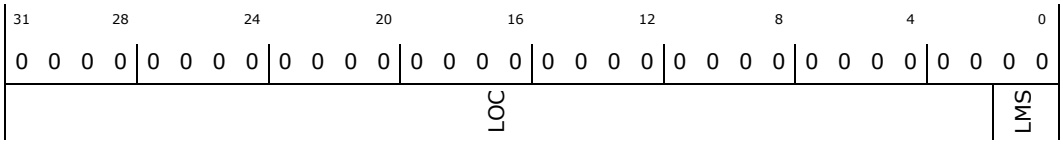
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 118h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.48 Linked List Pointer Register for Channel 3 - HIGH (LLP3_HI)—Offset 11Ch

Linked List Pointer Register for Channel 3

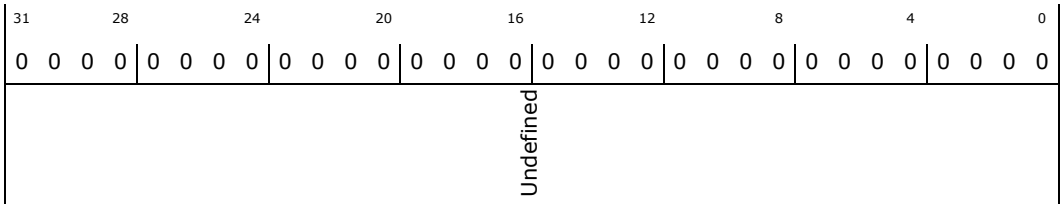
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 11Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.49 Control Register for Channel 3 - LOW (CTL3_LO)—Offset 120h

Control Register for Channel 3

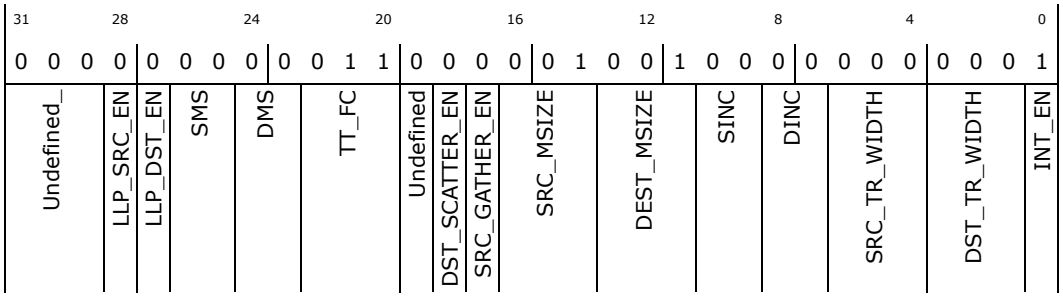
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 120h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.

Bit Range	Default & Access	Field Name (ID): Description
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.50 Control Register for Channel 3 - HIGH (CTL3_HI)—Offset 124h

Control Register for Channel 3

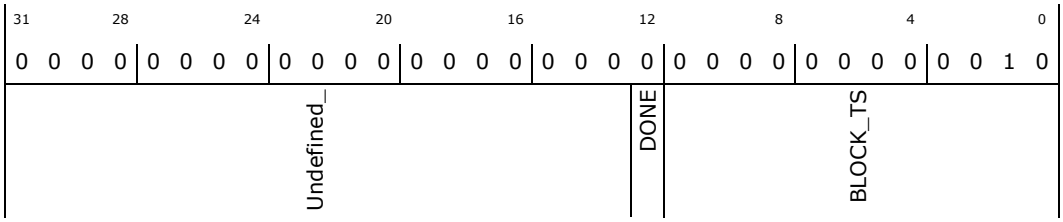
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 124h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.51 Configuration register for Channel 3 - LOW (CFG3_LO)—Offset 148h

Configuration register for Channel 3

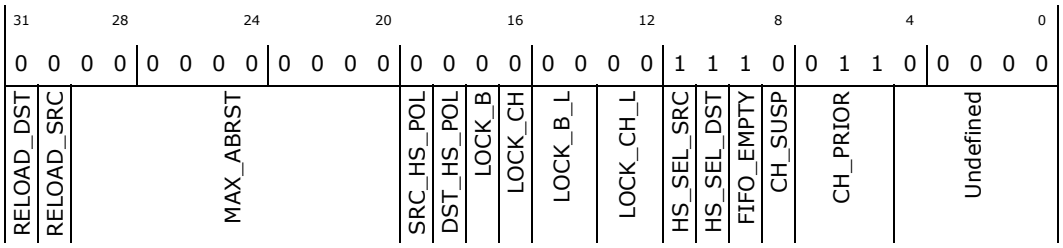
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 148h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E60h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x3 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0x0 RW	**Undefined:** RESERVED

9.2.52 Configuration register for Channel 3 - HIGH (CFG3_HI)—Offset 14Ch

Configuration register for Channel 3 _ HIGH

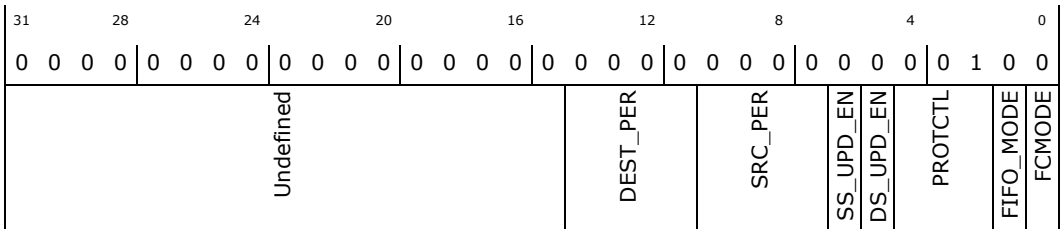
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 14Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.53 Source Gather Register for Channel 3 - LOW (SGR3_LO)—Offset 150h

Source Gather Register for Channel 3

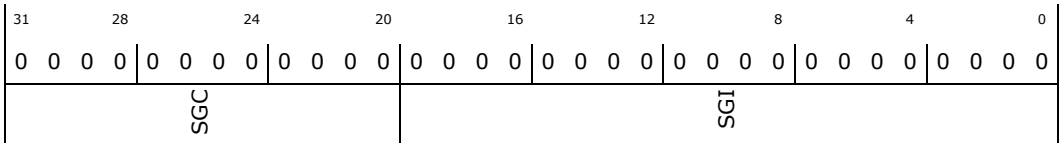
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 150h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.54 Source Gather Register for Channel 3 - HIGH (SGR3_HI)—Offset 154h

Source Gather Register for Channel 3

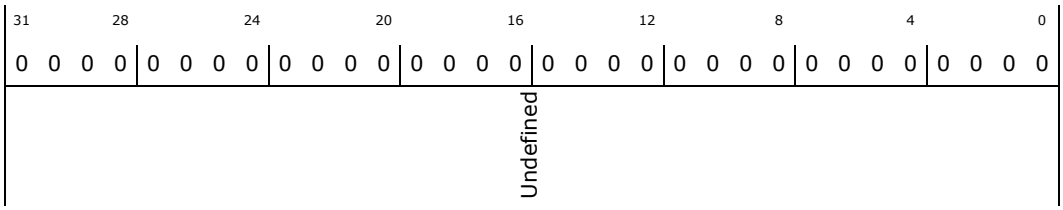
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 154h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.55 Destination Scatter Register for Channel 3 - LOW (DSR3_LO)—Offset 158h

Destination Scatter Register for Channel 3

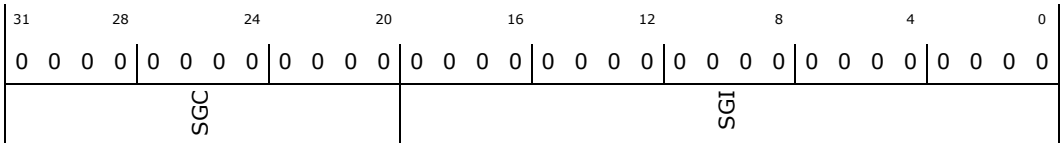
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 158h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.56 Dest scatter Register for Channel 3 - HIGH (DSR3_HI)—Offset 15Ch

Dest scatter Register for Channel 3

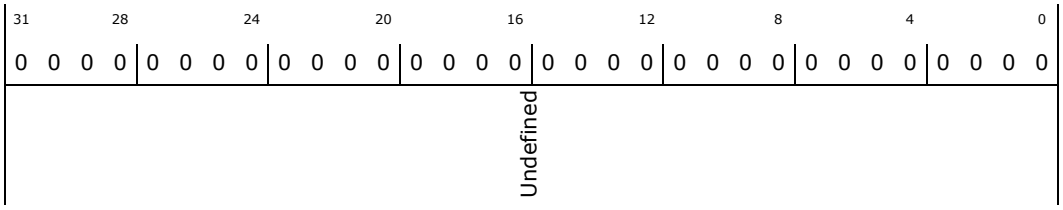
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 15Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.57 Source Address Register for Channel 4 - LOW (SAR4_LO)—Offset 160h

Source Address Register for Channel 4

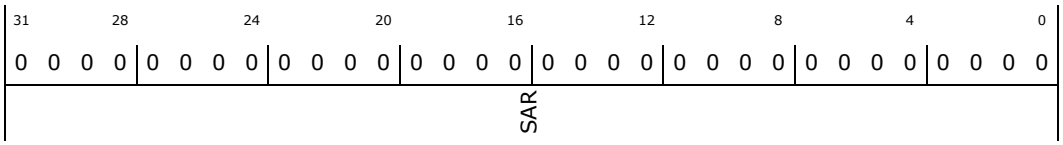
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 160h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.58 Source Address Register for Channel 4 - HIGH (SAR4_HI)—Offset 164h

Source Address Register for Channel 4

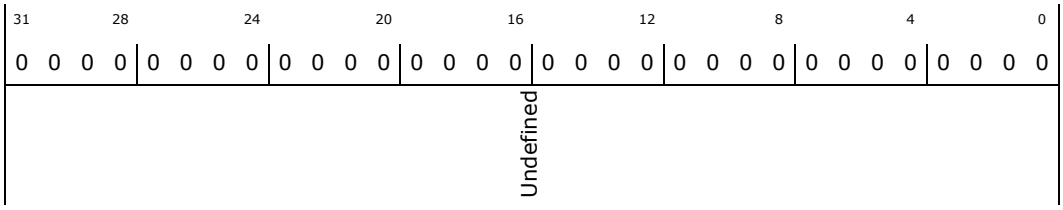
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 164h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.59 Destination Address Register for Channel 4 - LOW (DAR4_LO)—Offset 168h

Destination Address Register for Channel 4

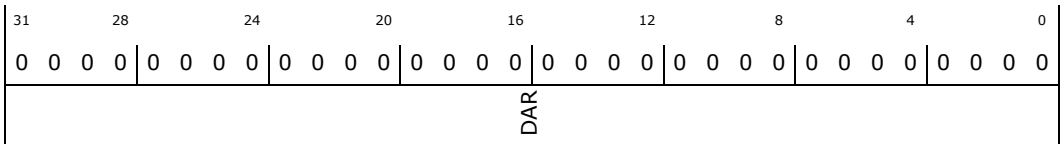
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 168h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.60 Destination Address Register for Channel 4 - HIGH (DAR4_HI)—Offset 16Ch

Destination Address Register for Channel 4

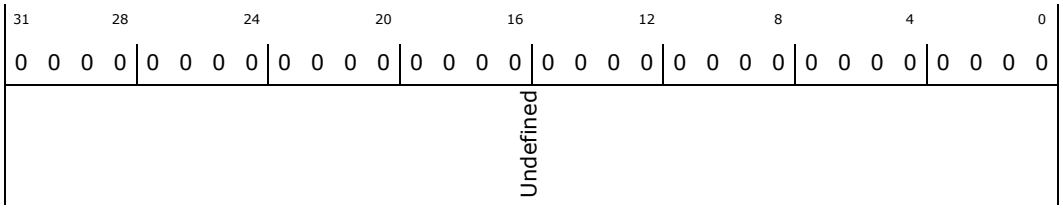
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 16Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.61 Linked List Pointer Register for Channel 4 - LOW (LLP4_LO)—Offset 170h

Linked List Pointer Register for Channel 4

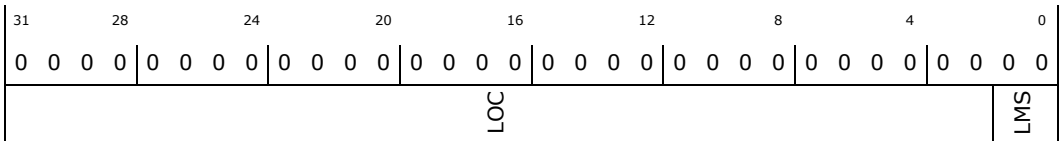
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 170h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.62 Linked List Pointer Register for Channel 4 - HIGH (LLP4_HI)—Offset 174h

Linked List Pointer Register for Channel 4

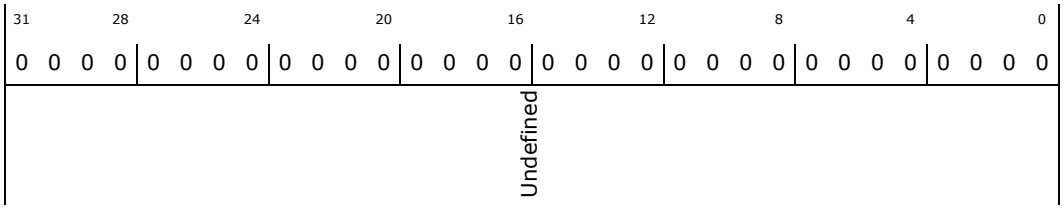
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 174h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.63 Control Register for Channel 4 - LOW (CTL4_LO)—Offset 178h

Control Register for Channel 4

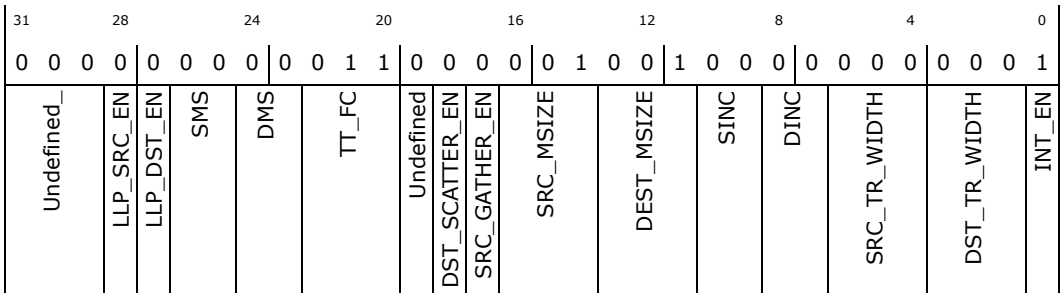
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 178h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.

Bit Range	Default & Access	Field Name (ID): Description
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.64 Control Register for Channel 4 - HIGH (CTL4_HI)—Offset 17Ch

Control Register for Channel 4

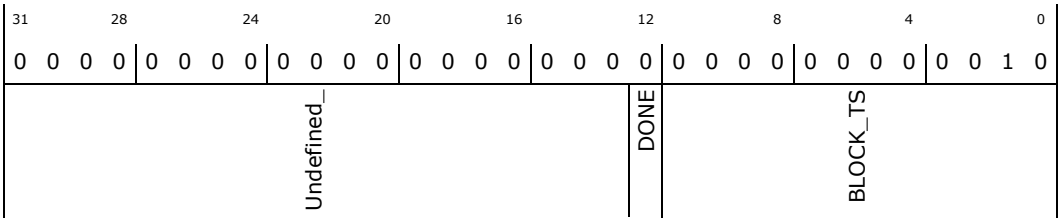
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 17Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.65 Configuration register for Channel 4 - LOW (CFG4_LO)—Offset 1A0h

Configuration register for Channel 4

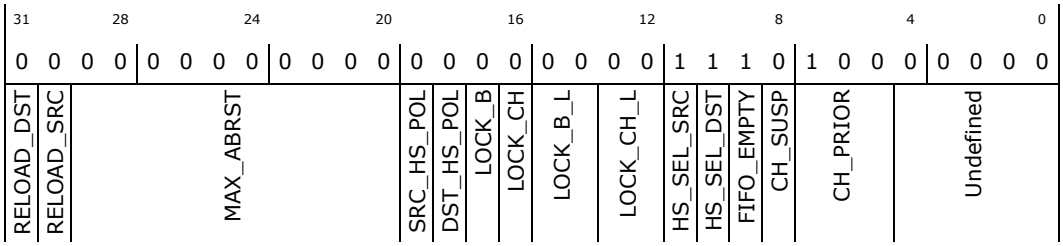
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1A0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E80h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x4 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.
4:0	0x0 RW	**Undefined:** RESERVED

9.2.66 Configuration register for Channel 4 - HIGH (CFG4_HI)—Offset 1A4h

Configuration register for Channel 4 _ HIGH

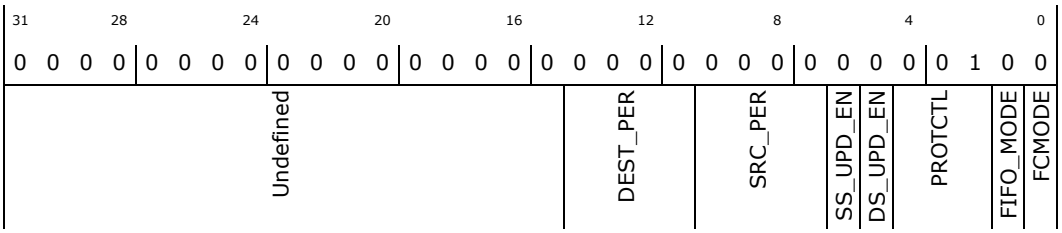
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1A4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.67 Source Gather Register for Channel 4 - LOW (SGR4_LO)—Offset 1A8h

Source Gather Register for Channel 4

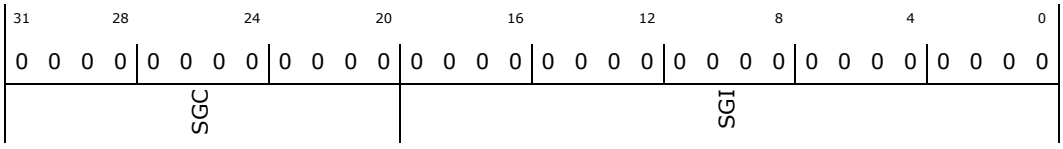
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1A8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.68 Source Gather Register for Channel 4 - HIGH (SGR4_HI)—Offset 1ACh

Source Gather Register for Channel 4

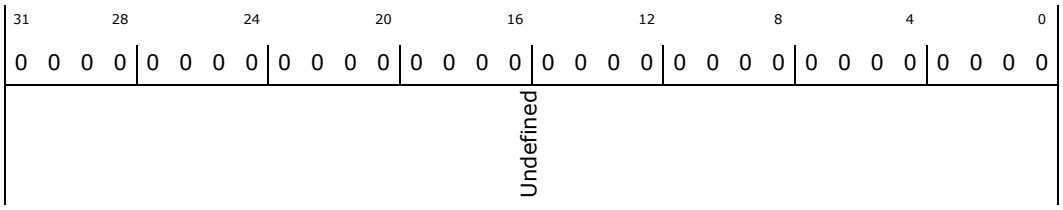
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1ACh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.69 Destination Scatter Register for Channel 4 - LOW (DSR4_LO)—Offset 1B0h

Destination Scatter Register for Channel 4

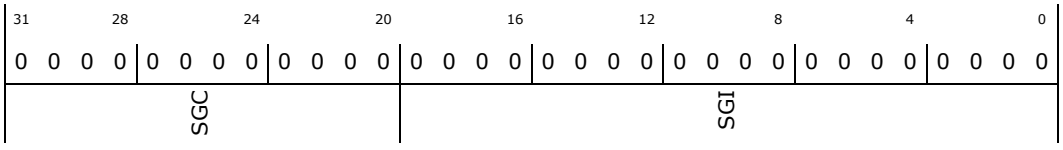
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1B0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.70 Dest scatter Register for Channel 4 - HIGH (DSR4_HI)—Offset 1B4h

Dest scatter Register for Channel 4

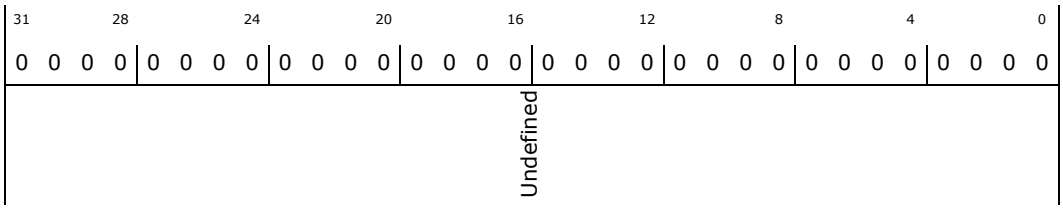
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1B4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.71 Source Address Register for Channel 5 - LOW (SAR5_LO)—Offset 1B8h

Source Address Register for Channel 5

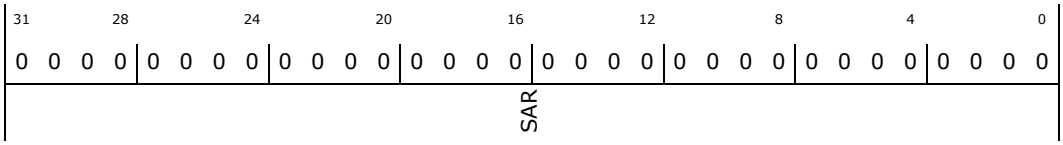
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1B8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.72 Source Address Register for Channel 5 - HIGH (SAR5_HI)—Offset 1BCh

Source Address Register for Channel 5

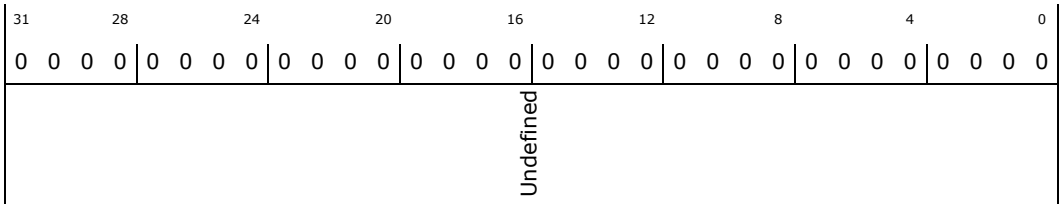
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1BCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.73 Destination Address Register for Channel 5 - LOW (DAR5_LO)—Offset 1C0h

Destination Address Register for Channel 5

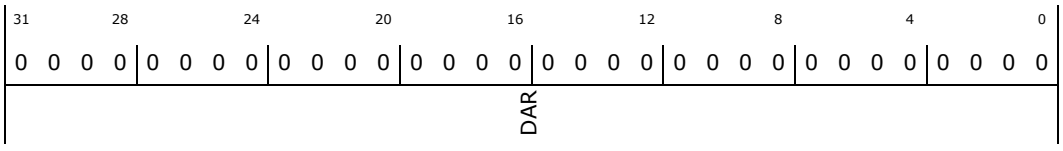
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1C0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.74 Destination Address Register for Channel 5 - HIGH (DAR5_HI)—Offset 1C4h

Destination Address Register for Channel 5

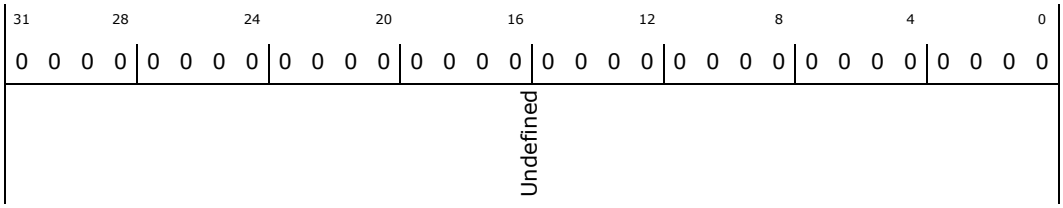
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1C4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.75 Linked List Pointer Register for Channel 5 - LOW (LLP5_LO)—Offset 1C8h

Linked List Pointer Register for Channel 5

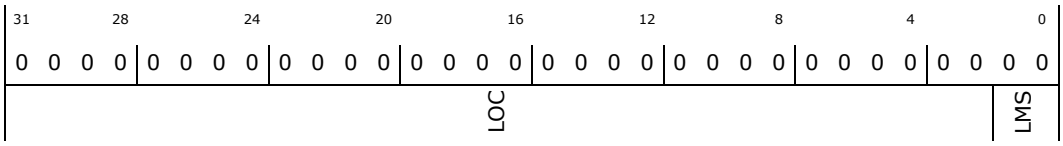
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1C8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.76 Linked List Pointer Register for Channel 5 - HIGH (LLP5_HI)—Offset 1CCh

Linked List Pointer Register for Channel 5

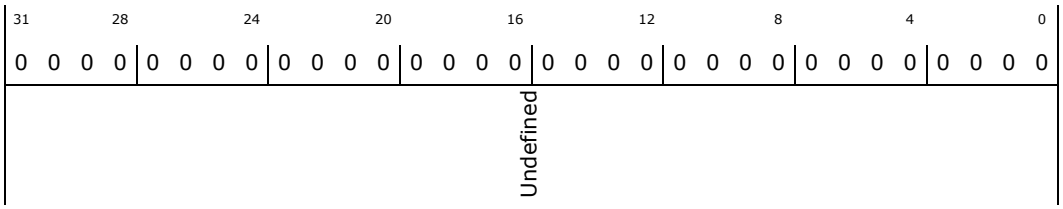
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1CCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.77 Control Register for Channel 5 - LOW (CTL5_LO)—Offset 1D0h

Control Register for Channel 5

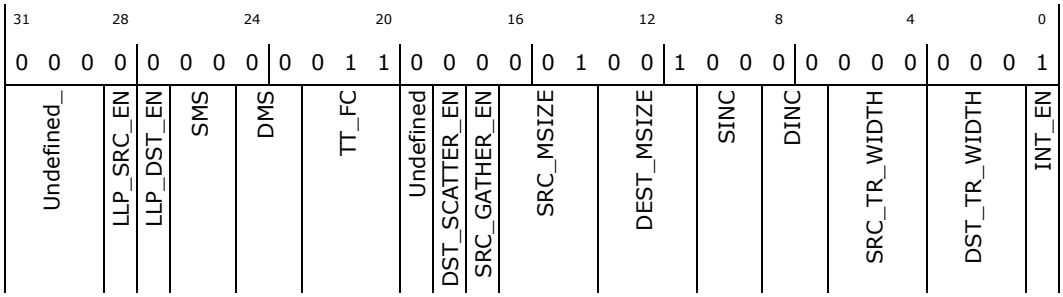
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1D0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW	**Undefined_:** RESERVED
28	0x0 RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0x0 RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0x0 RW	**SMS:** Source Master Select. Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0x0 RW	**DMS:** Destination Master Select. Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	0x3 RW	**TT_FC:** Transfer Type and Flow Control.
19	0x0 RW	**Undefined:** RESERVED
18	0x0 RW	**DST_SCATTER_EN:** Destination scatter enable bit. 0 = disabled 1 = enabled
17	0x0 RW	**SRC_GATHER_EN:** Source gather enable bit. 0 = disabled 1 = enabled
16:14	0x1 RW	**SRC_MSIZE:** Source Burst Transaction Length.
13:11	0x1 RW	**DEST_MSIZE:** Destination Burst Transaction Length.
10:9	0x0 RW	**SINC:** Source Address Increment. 00 = Increment 01 = Decrement 1x = No change
8:7	0x0 RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0x0 RW	**SRC_TR_WIDTH:** Source Transfer Width. This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0x0 RW	**DST_TR_WIDTH:** Destination Transfer Width. This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	0x1 RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

9.2.78 Control Register for Channel 5 - HIGH (CTL5_HI)—Offset 1D4h

Control Register for Channel 5

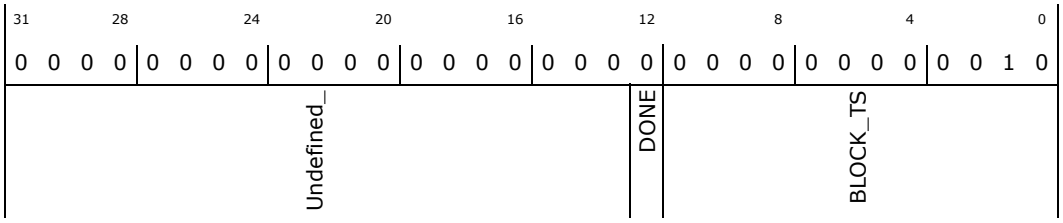
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1D4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RW	**Undefined_:** RESERVED
12	0x0 RW	**DONE:** Done bit
11:0	0x2 RW	**BLOCK_TS:** Block Transfer Size. When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

9.2.79 Configuration register for Channel 5 - LOW (CFG5_LO)—Offset 1F8h

Configuration register for Channel 5

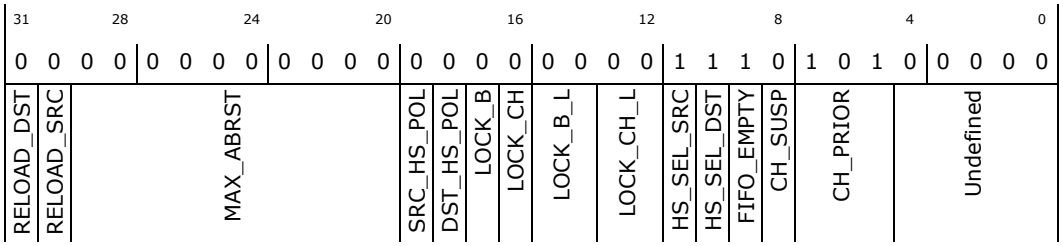
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1F8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000EA0h



Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RELOAD_DST:** Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0x0 RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0x0 RW	**MAX_ABRST:** Maximum AMBA Burst Length. Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0x0 RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0x0 RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17	0x0 RW	**LOCK_B:** Bus Lock Bit. When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0x0 RW	**LOCK_CH:** Channel Lock Bit. When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0x0 RW	**LOCK_B_L:** Bus Lock Level. Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0x0 RW	**LOCK_CH_L:** Channel Lock Level. Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	0x1 RW	**HS_SEL_SRC:** Source Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
10	0x1 RW	**HS_SEL_DST:** Destination Software or Hardware Handshaking Select. 0 = HW handshaking 1 = SW handshaking
9	0x1 RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO.
8	0x0 RW	**CH_SUSP:** Channel Suspend. Suspends all DMA transfers from source until this bit is cleared.
7:5	0x5 RW	**CH_PRIOR:** Channel priority. Priority of 7 is the highest priority.
4:0	0x0 RW	**Undefined:** RESERVED

9.2.80 Configuration register for Channel 5 - HIGH (CFG5_HI)—Offset 1FCh

Configuration register for Channel 5 _ HIGH

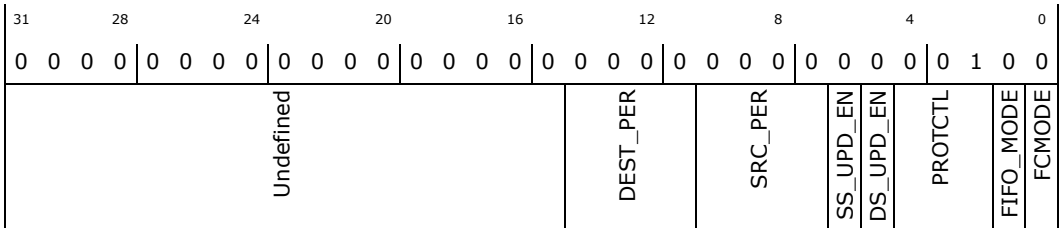
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 1FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Undefined:** Reserved
14:11	0x0 RW	**DEST_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0x0 RW	**SRC_PER:** Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0x0 RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0x0 RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	0x1 RW	**PROTCTL:** Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0x0 RW	**FIFO_MODE:** FIFO Mode Select. Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0x0 RW	**FCMODE:** Flow Control Mode. Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

9.2.81 Source Gather Register for Channel 5 - LOW (SGR5_LO)—Offset 200h

Source Gather Register for Channel 5

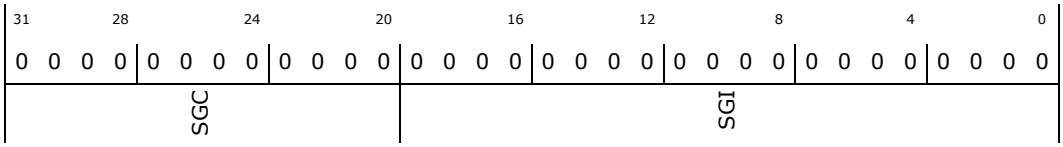
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 200h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0x0 RW	**SGI:** Source gather interval

9.2.82 Source Gather Register for Channel 5 - HIGH (SGR5_HI)—Offset 204h

Source Gather Register for Channel 5

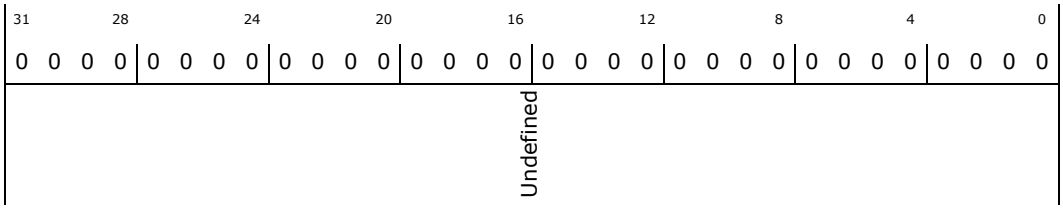
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 204h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.83 Destination Scatter Register for Channel 5 - LOW (DSR5_LO)—Offset 208h

Destination Scatter Register for Channel 5

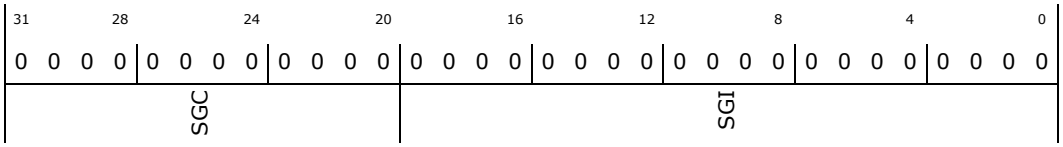
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 208h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**DSC (SGC):** Dest scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0x0 RW	**DSI (SGI):** Dest scatter interval

9.2.84 Dest scatter Register for Channel 5 - HIGH (DSR5_HI)—Offset 20Ch

Dest scatter Register for Channel 5

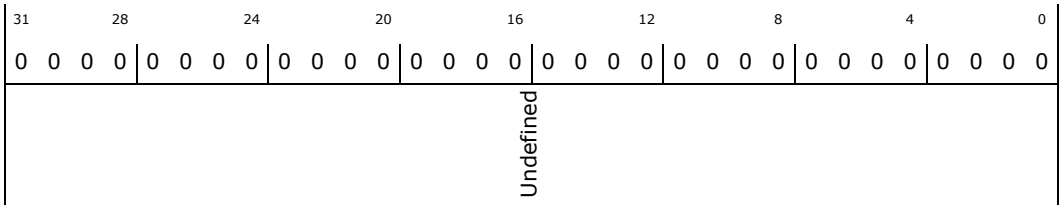
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 20Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.85 Source Address Register for Channel 6 - LOW (SAR6_LO)—Offset 210h

Source Address Register for Channel 6

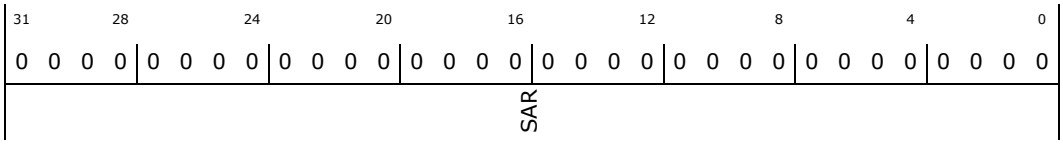
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 210h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

9.2.86 Source Address Register for Channel 6 - HIGH (SAR6_HI)—Offset 214h

Source Address Register for Channel 6

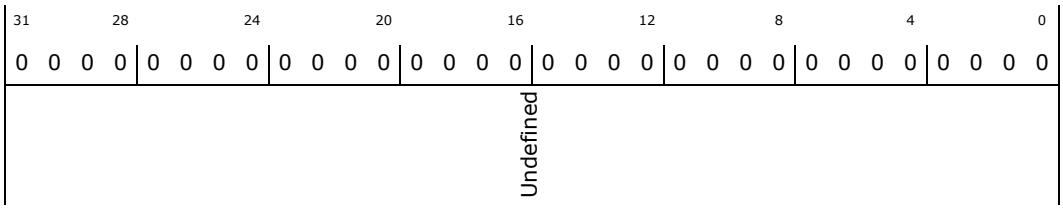
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 214h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.87 Destination Address Register for Channel 6 - LOW (DAR6_LO)—Offset 218h

Destination Address Register for Channel 6

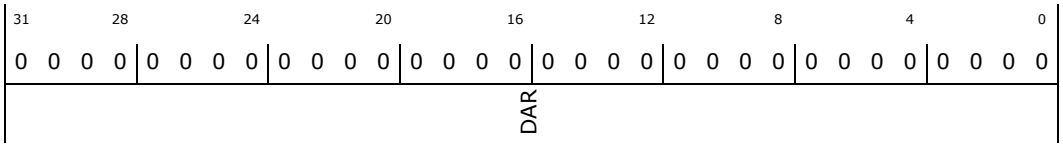
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 218h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**DAR:** Current Destination address of DMA transfer. Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

9.2.88 Destination Address Register for Channel 6 - HIGH (DAR6_HI)—Offset 21Ch

Destination Address Register for Channel 6

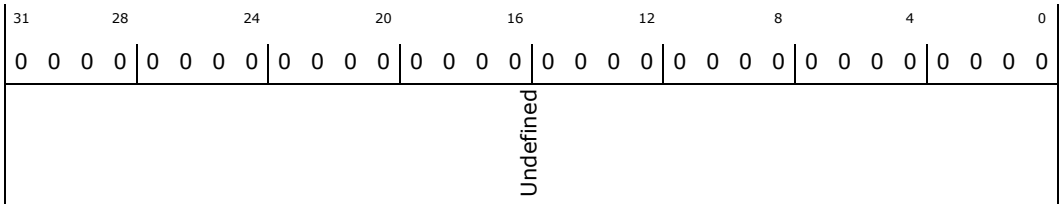
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 21Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** Reserved

9.2.89 Linked List Pointer Register for Channel 6 - LOW (LLP6_LO)—Offset 220h

Linked List Pointer Register for Channel 6

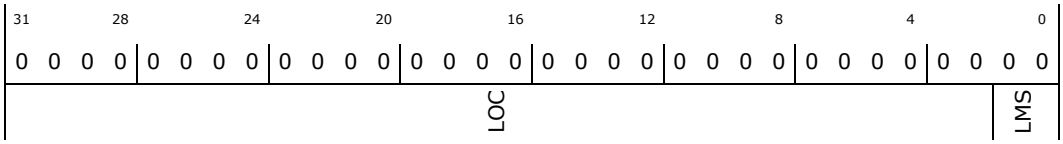
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 220h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0x0 RW	**LMS:** List Master Select. Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

9.2.90 Linked List Pointer Register for Channel 6 - HIGH (LLP6_HI)—Offset 224h

Linked List Pointer Register for Channel 6

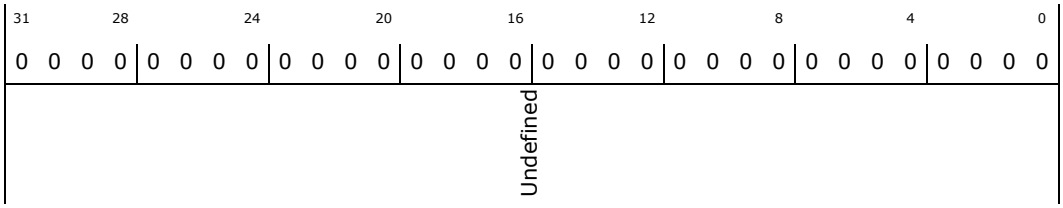
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 224h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Undefined:** RESERVED

9.2.91 Control Register for Channel 6 - LOW (CTL6_LO)—Offset 228h

Control Register for Channel 6

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 228h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00304801h
